

RHEL9

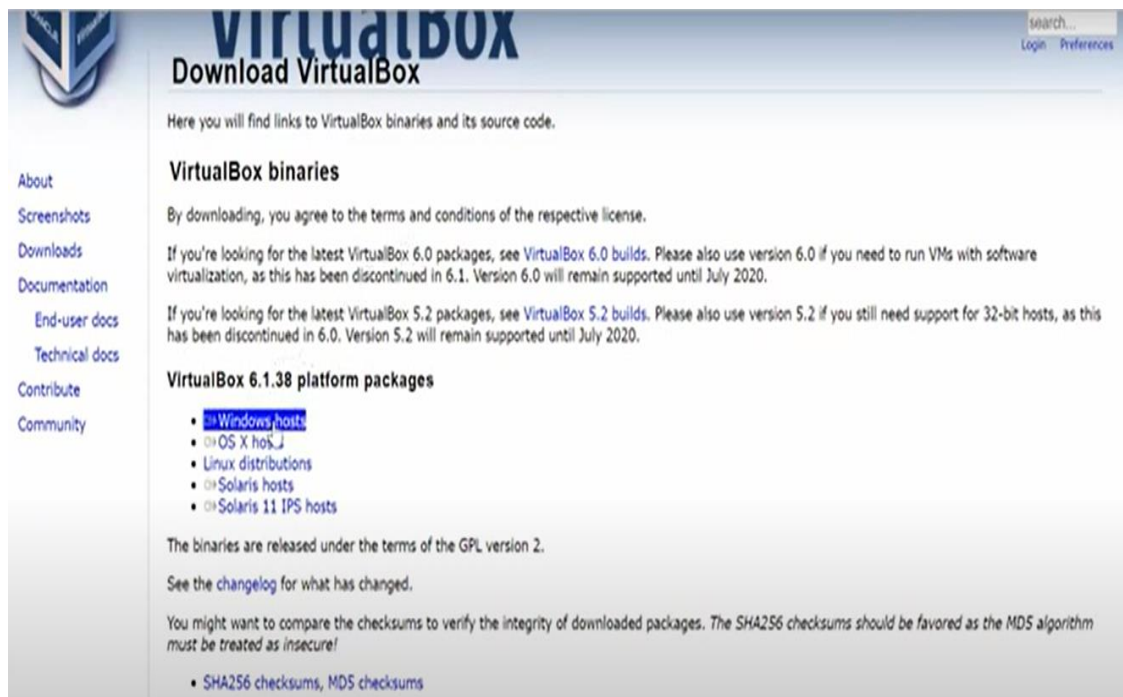

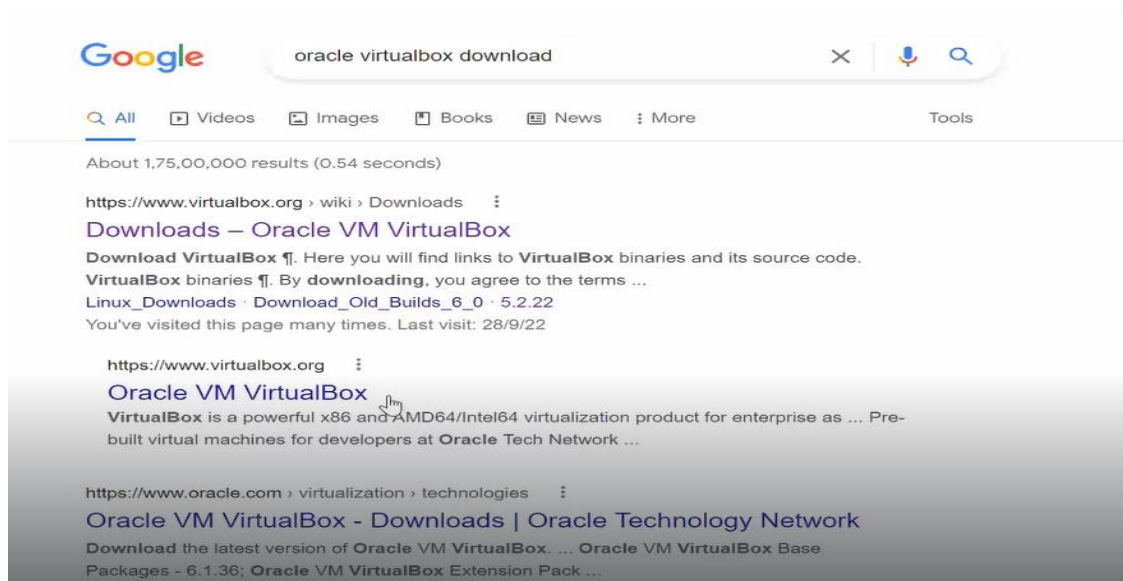

Session 1 – 8th October 2022 SUMMARY

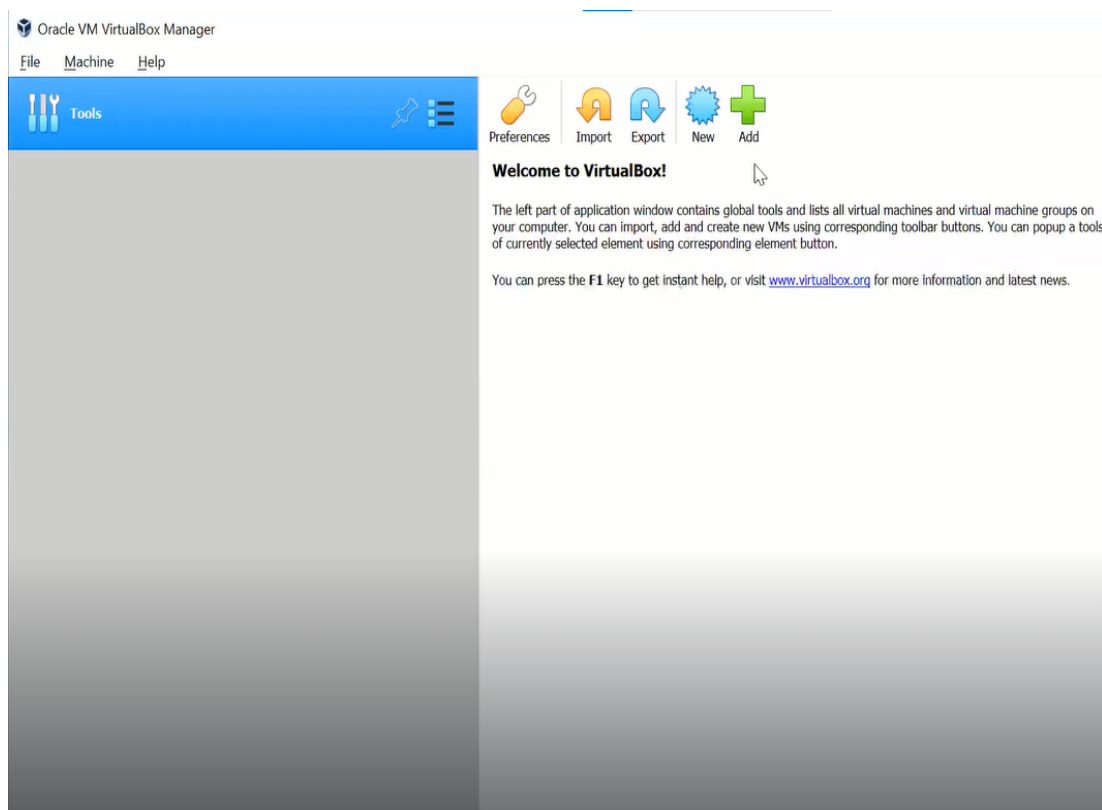

Detailed Discussion on below points –

- The use case of OS (Operating System) – for one single purpose – to run the program (VLC Player, Notepad, Browser etc)
- Program is written in some kind of programming language (C++, JAVA, Python etc) that is Code or Program File or Command.
- The three main components in a system is
 - RAM
 - CPU
 - Hard Disk
- To store data
 - Permanent or Persistent – Hard Disk is used
 - Temporary – RAM is used
- The only way to store data in a Hard Disk is to put the data in a file
- To create a file, first we have to create a folder or directory
- To interact with OS, we have to run or execute the program file or command
- When we run a command, its loaded from Hard Disk into RAM and becomes a process
- Most of the companies in the world in their data centers use Linux OS

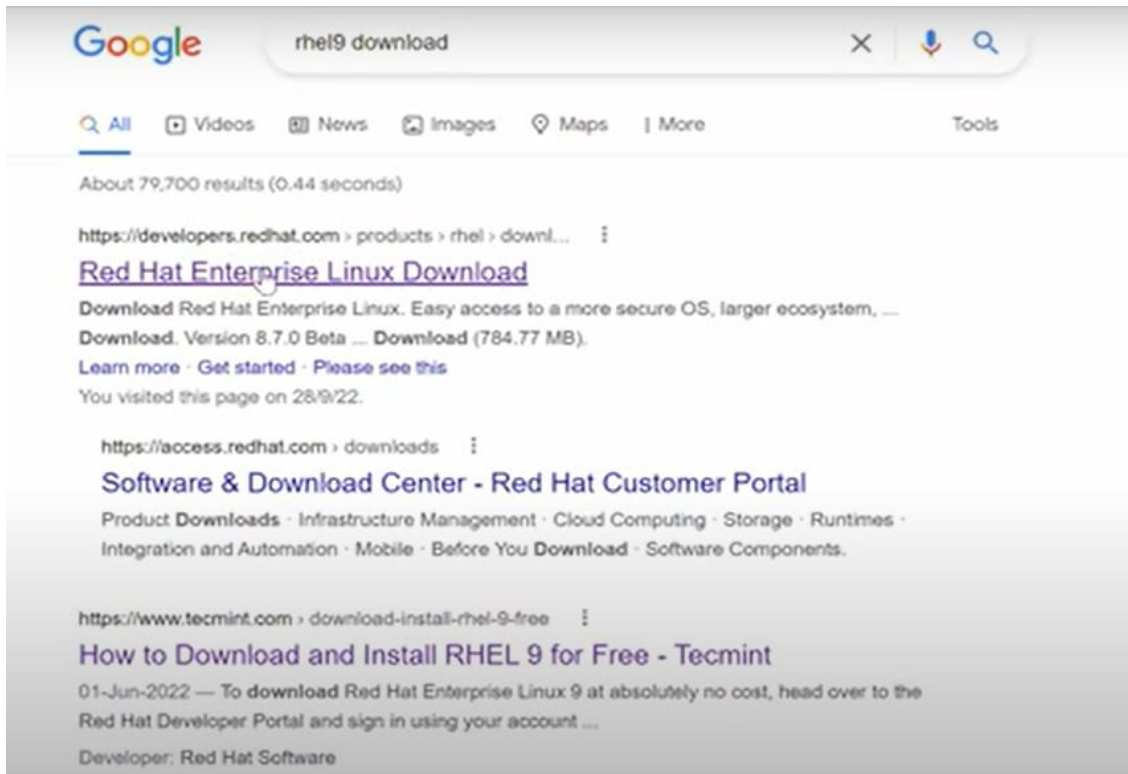

- The four different ways to install OS
 - Directly on the Hardware(Laptop, Server) - Baremetal
 - Cloud Computing Platform(Azure, AWS)
 - Containerization Technology(Docker, Kubernetes)
 - Virtualization Concept – Install Linux OS on Base OS(windows, MAC)
- The product to implement Virtualization concept is the Oracle Virtual Box

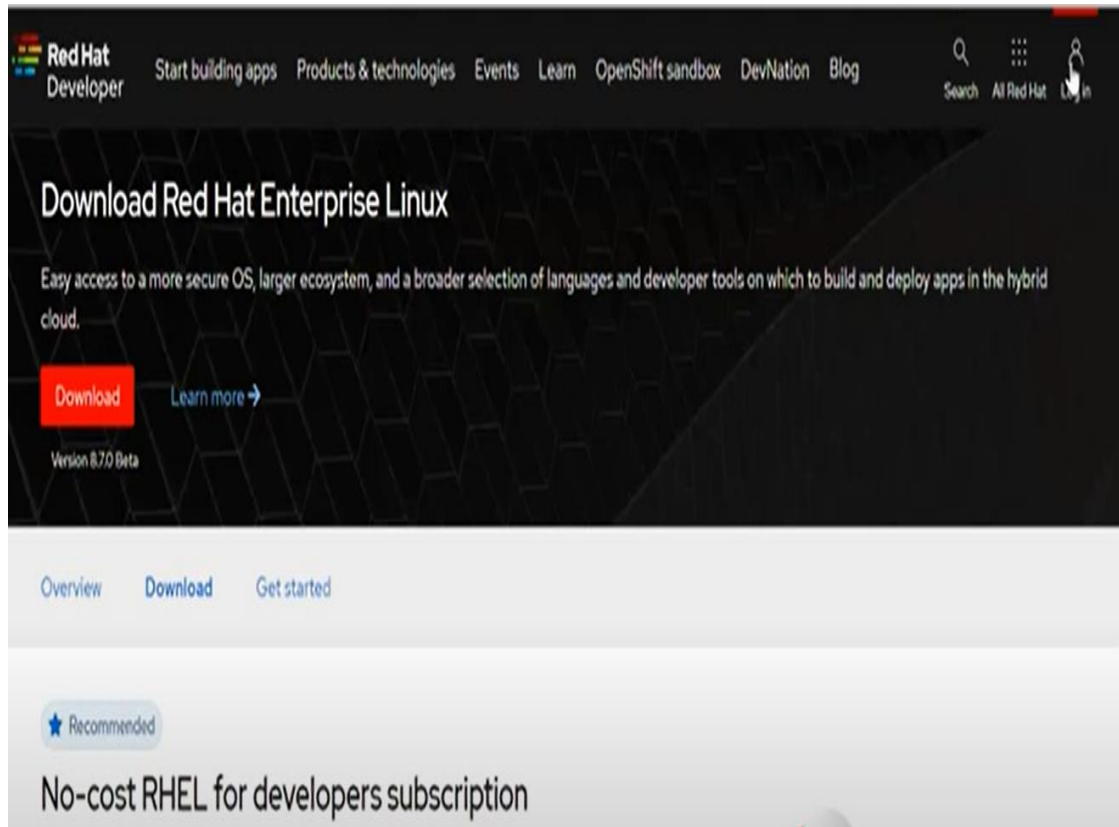

- To install any OS, the minimum requirement is the image or bootable image or set-up file or OS Image
- To download set-up image for RedHat 9 (RHEL9) -

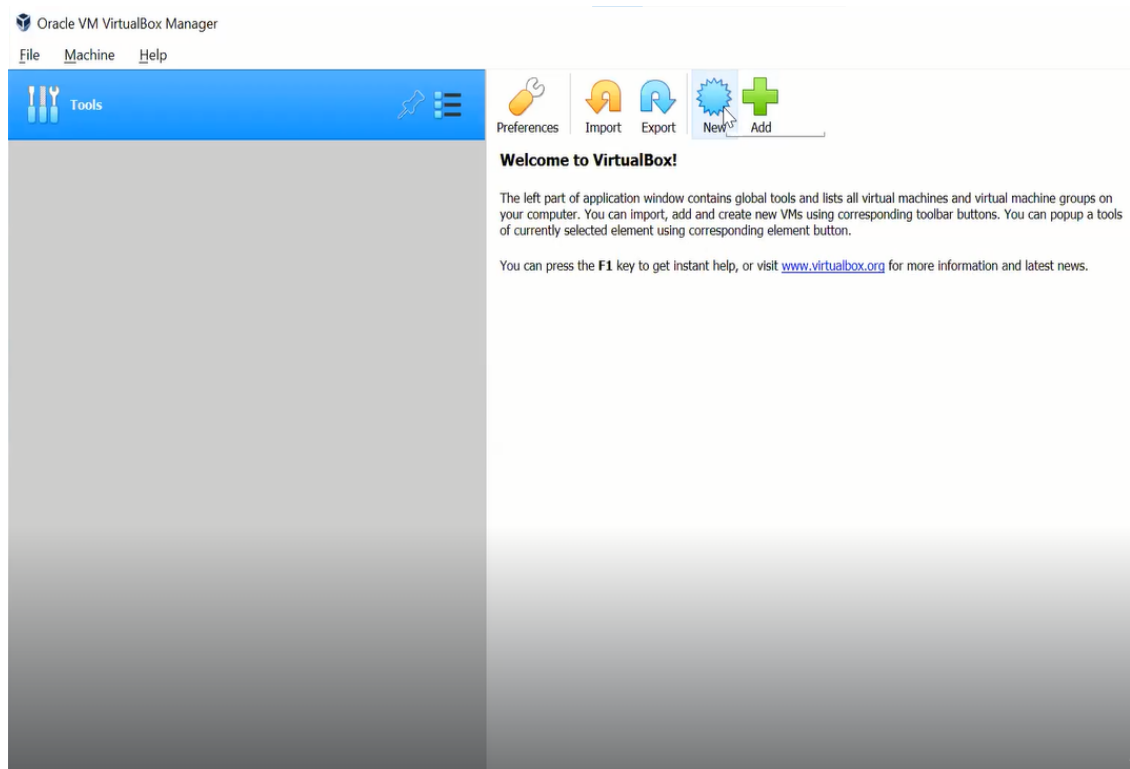

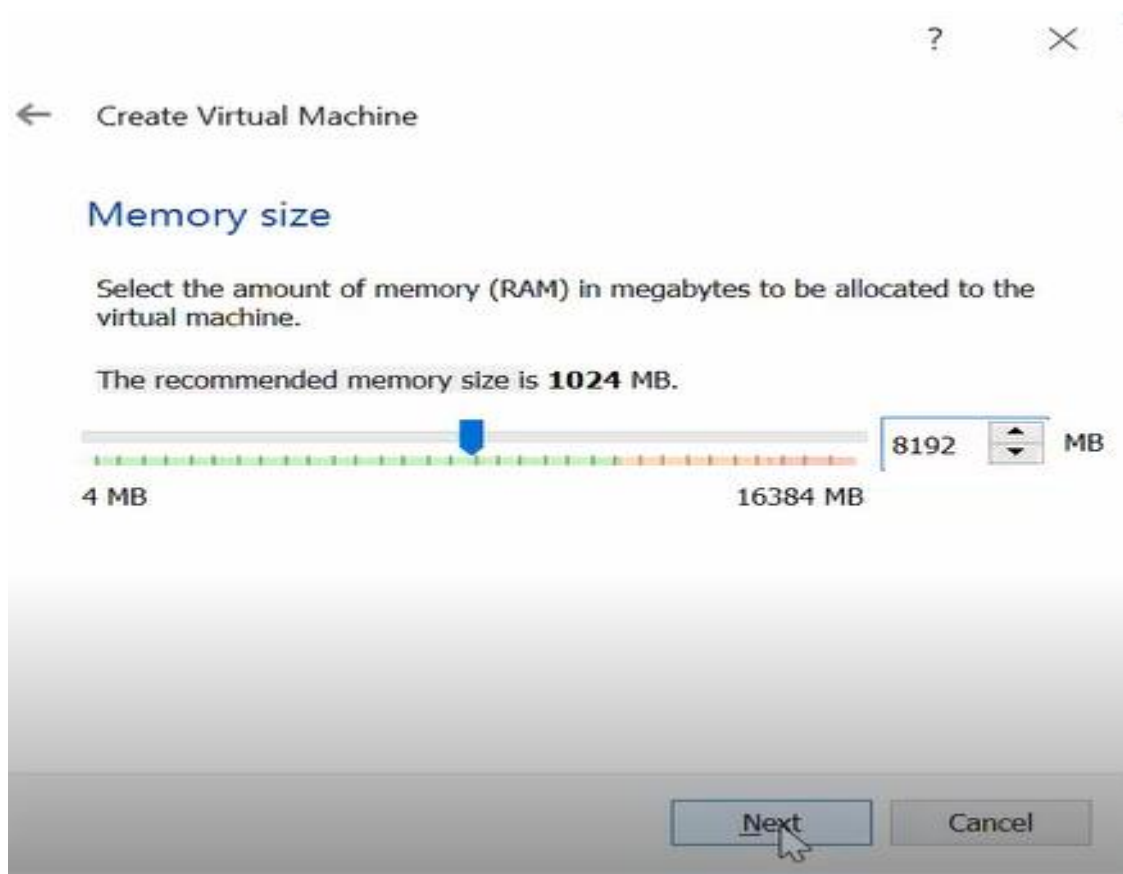

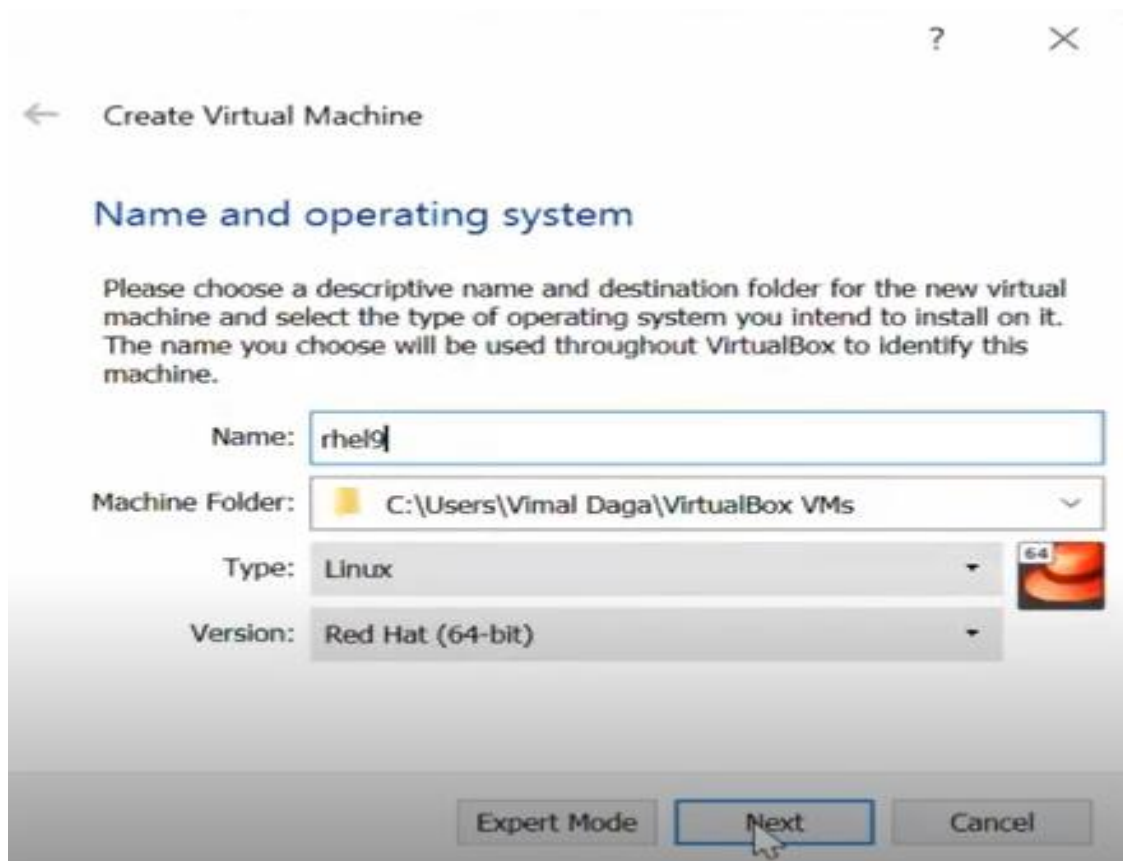

9.0

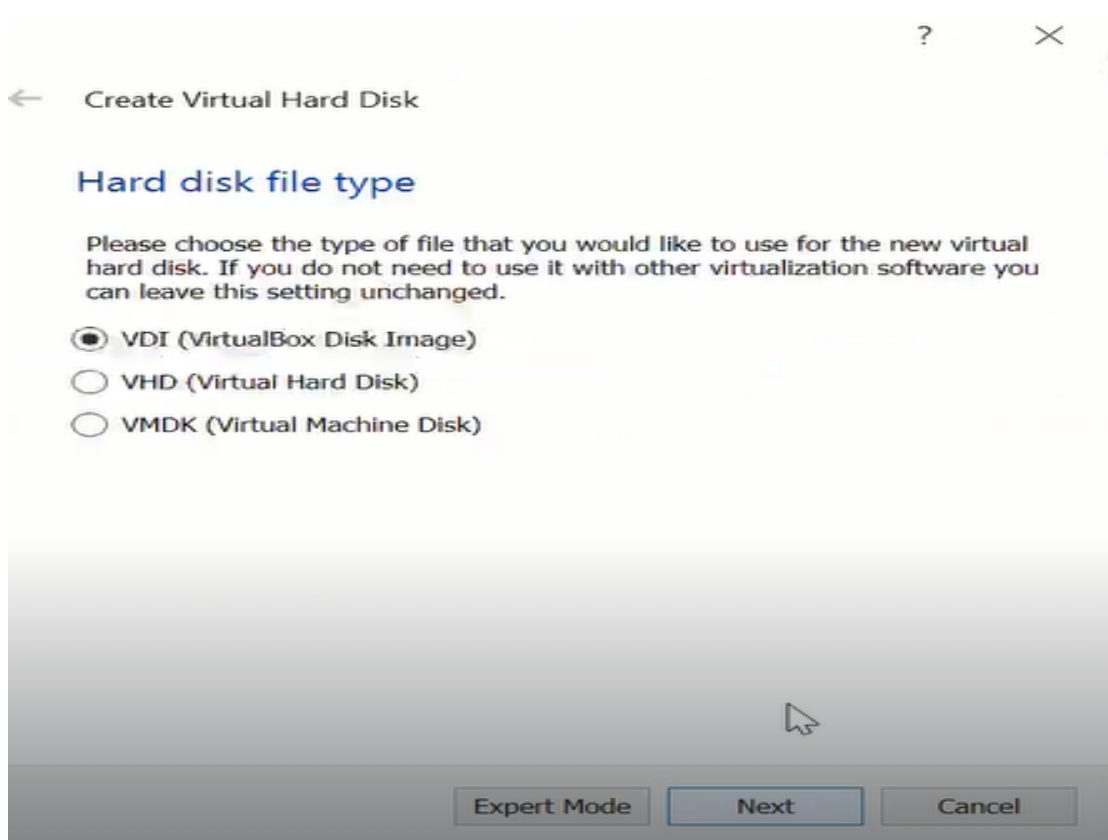

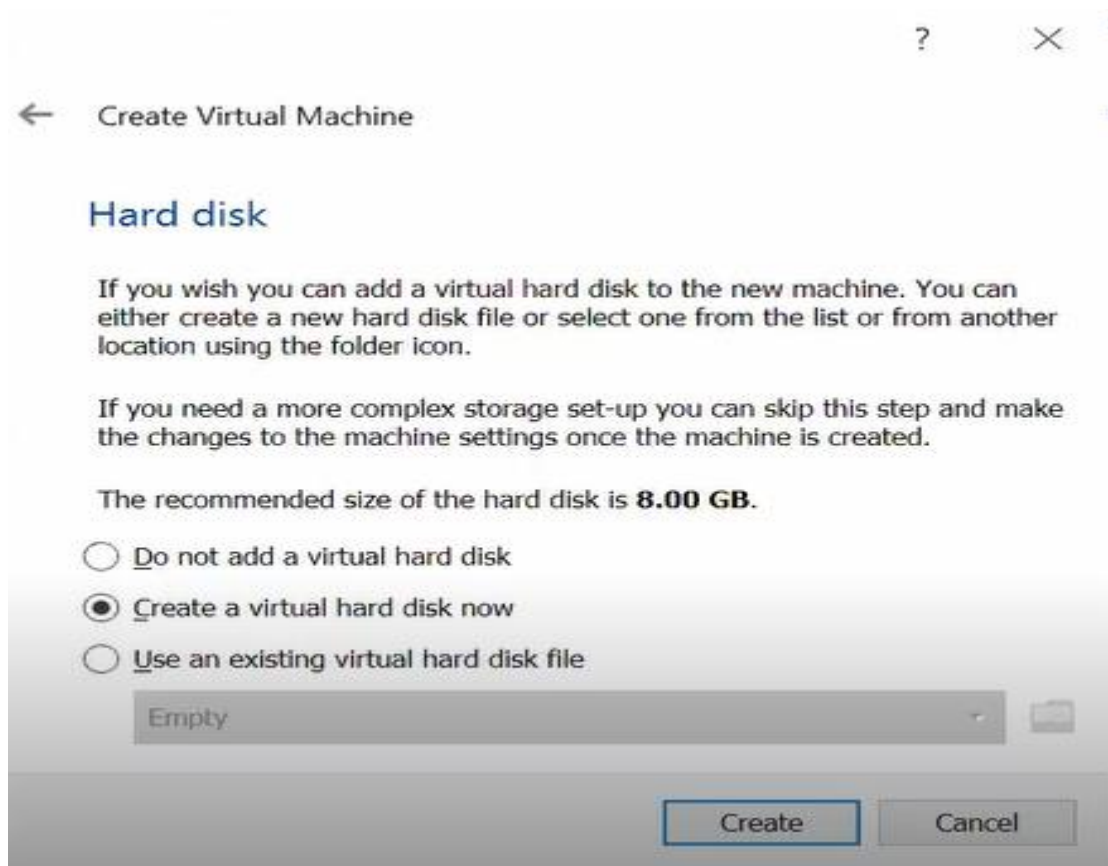

x86_64	Boot iso	Release date May 17, 2022	Download (766 MB)
aarch64	Boot iso	Release date May 17, 2022	Download (723.26 MB)
x86_64	DVD iso	Release date May 17, 2022	Download (7.9 GB)
aarch64	DVD iso	Release date May 17, 2022	Download (6.37 GB)

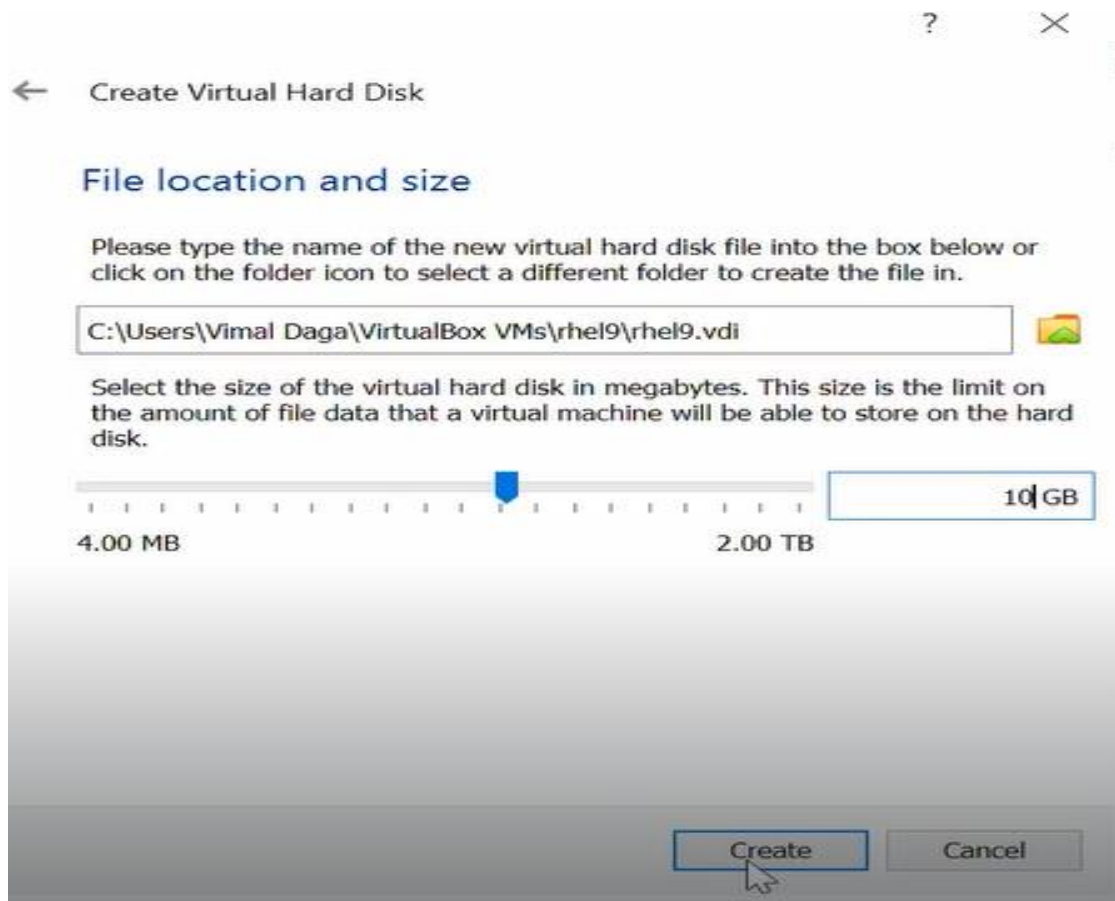

- To install the set- up image – click on New

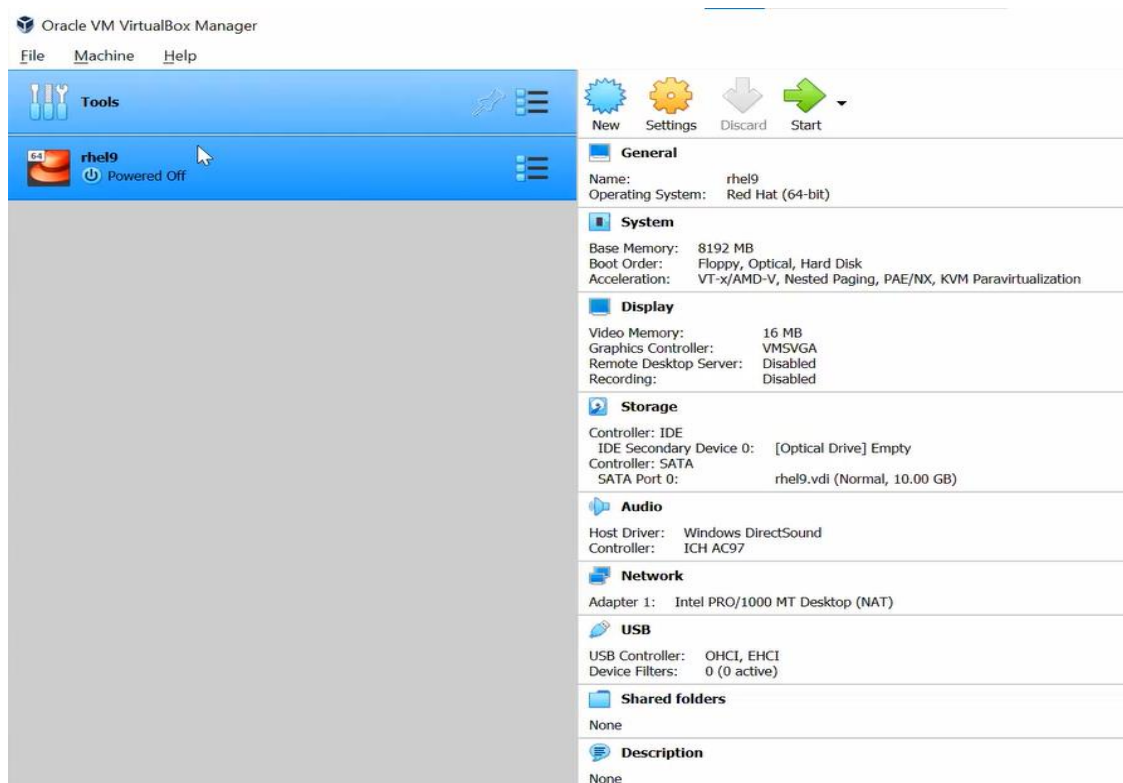

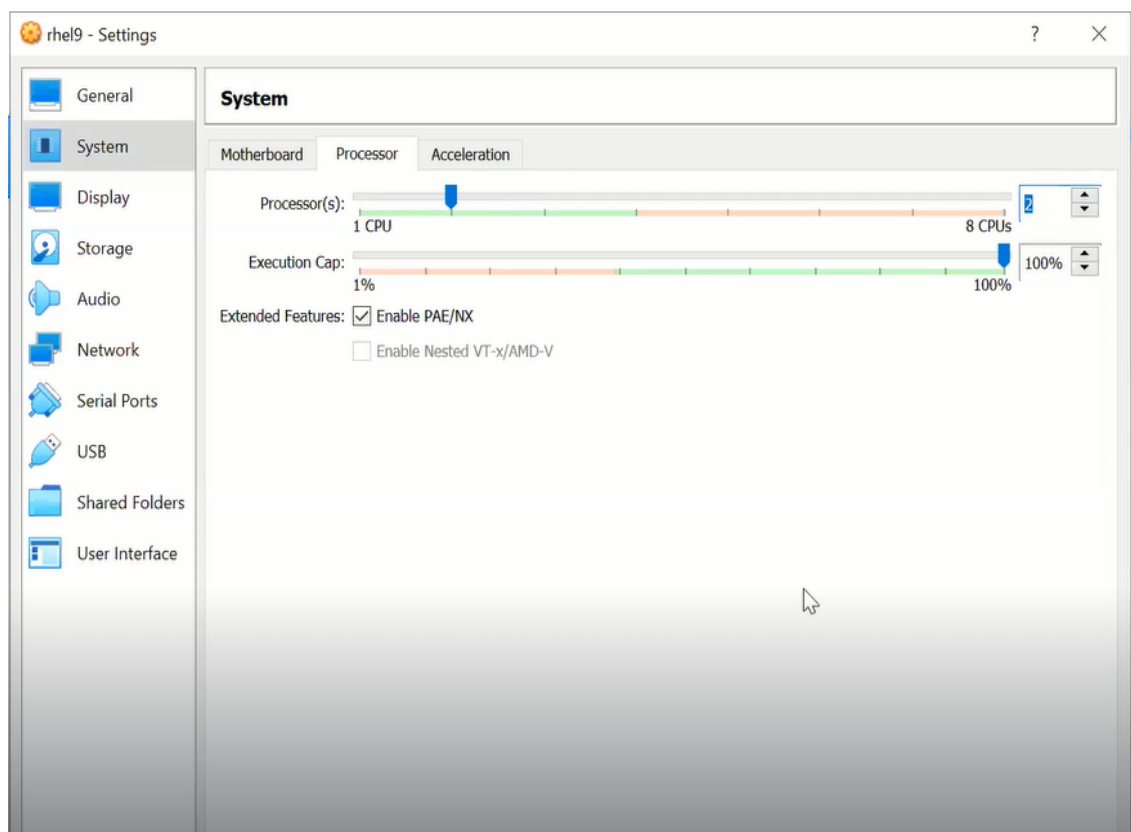

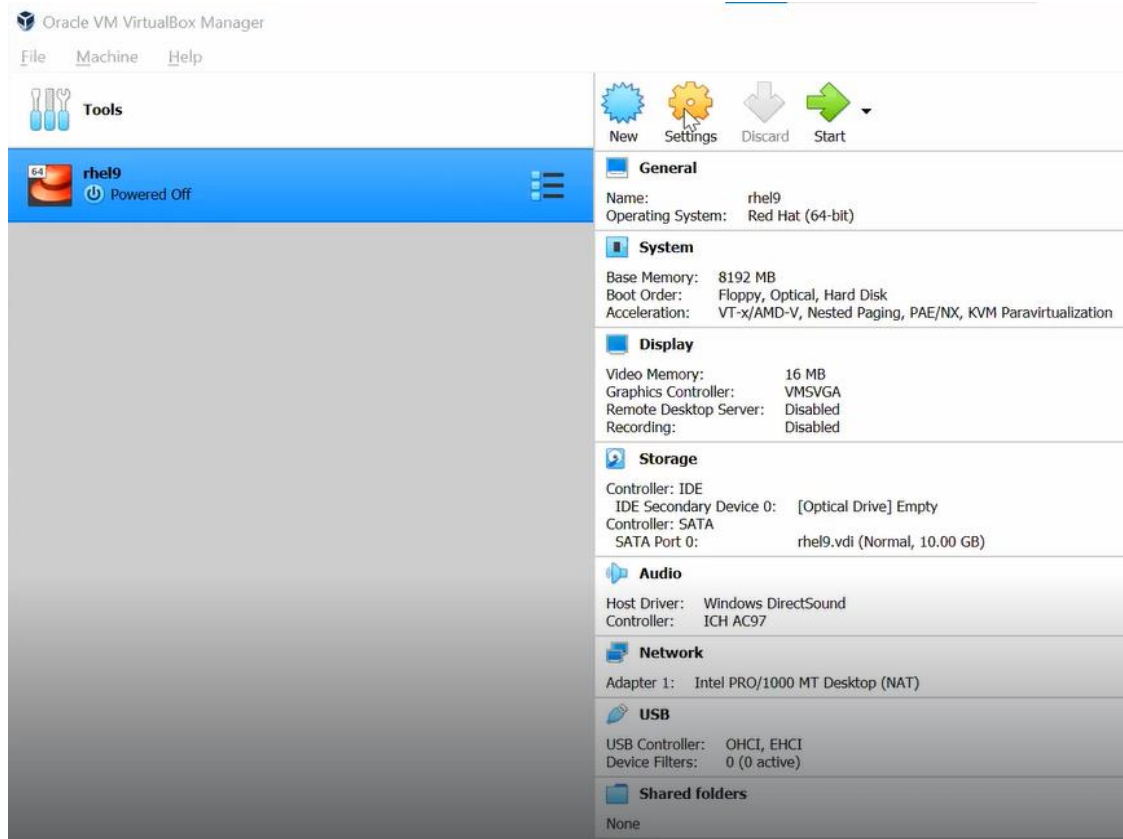

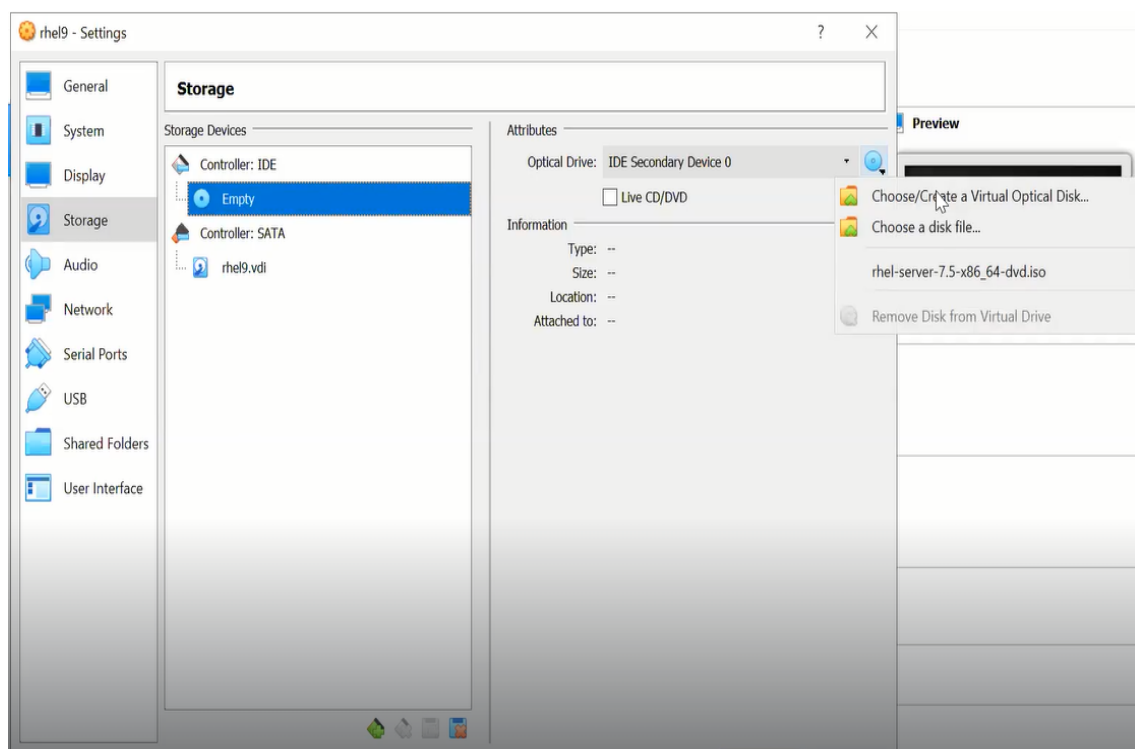

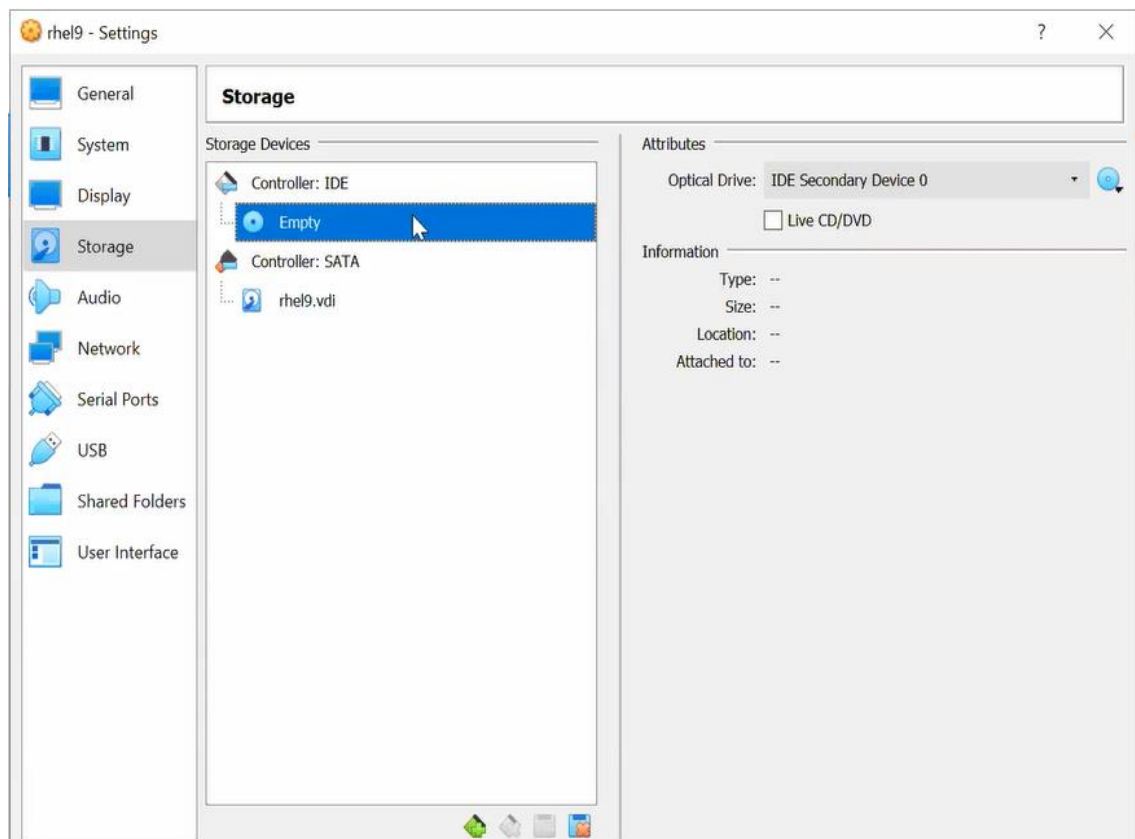

- A new virtual machine created –

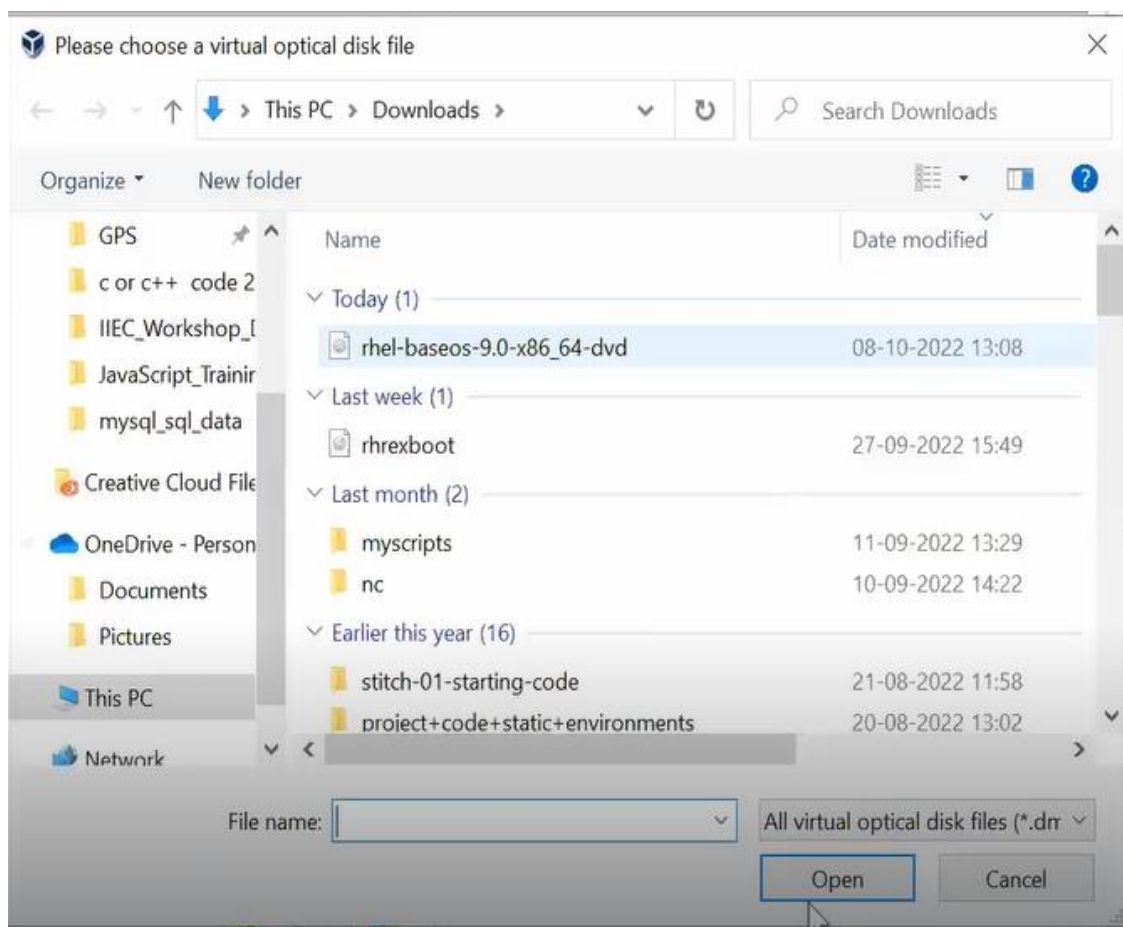

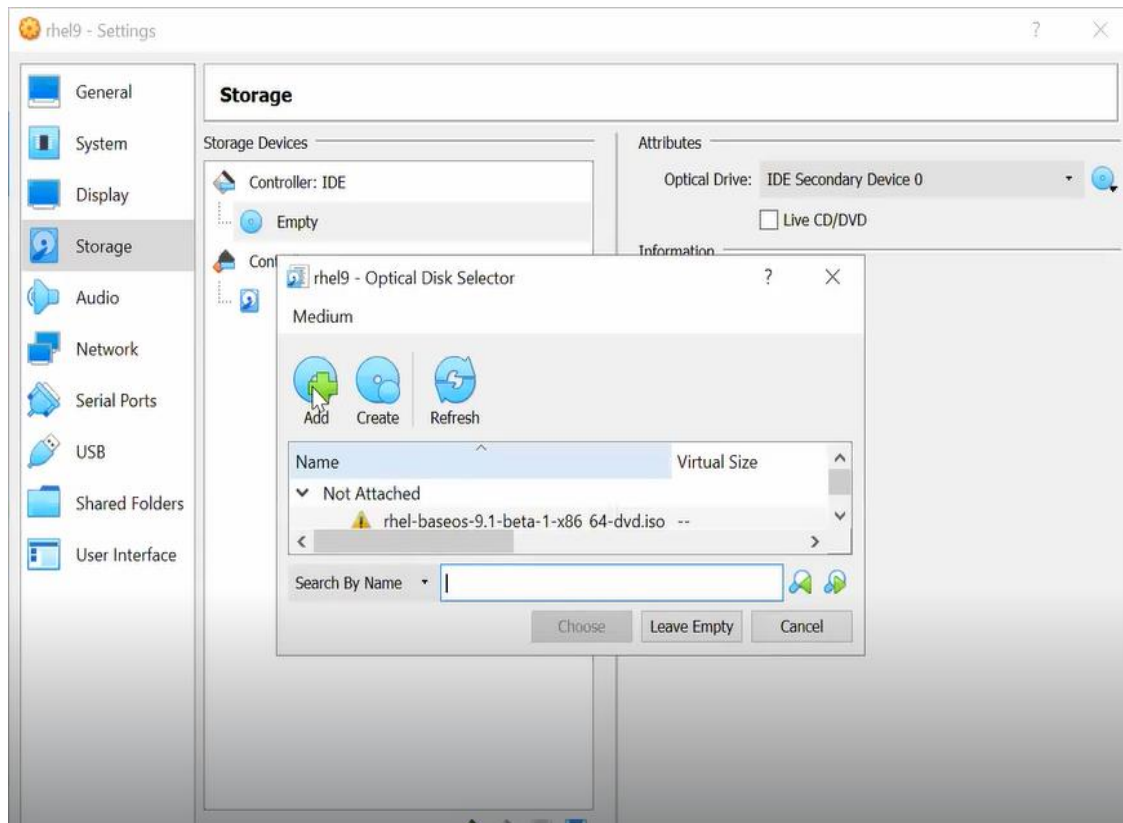

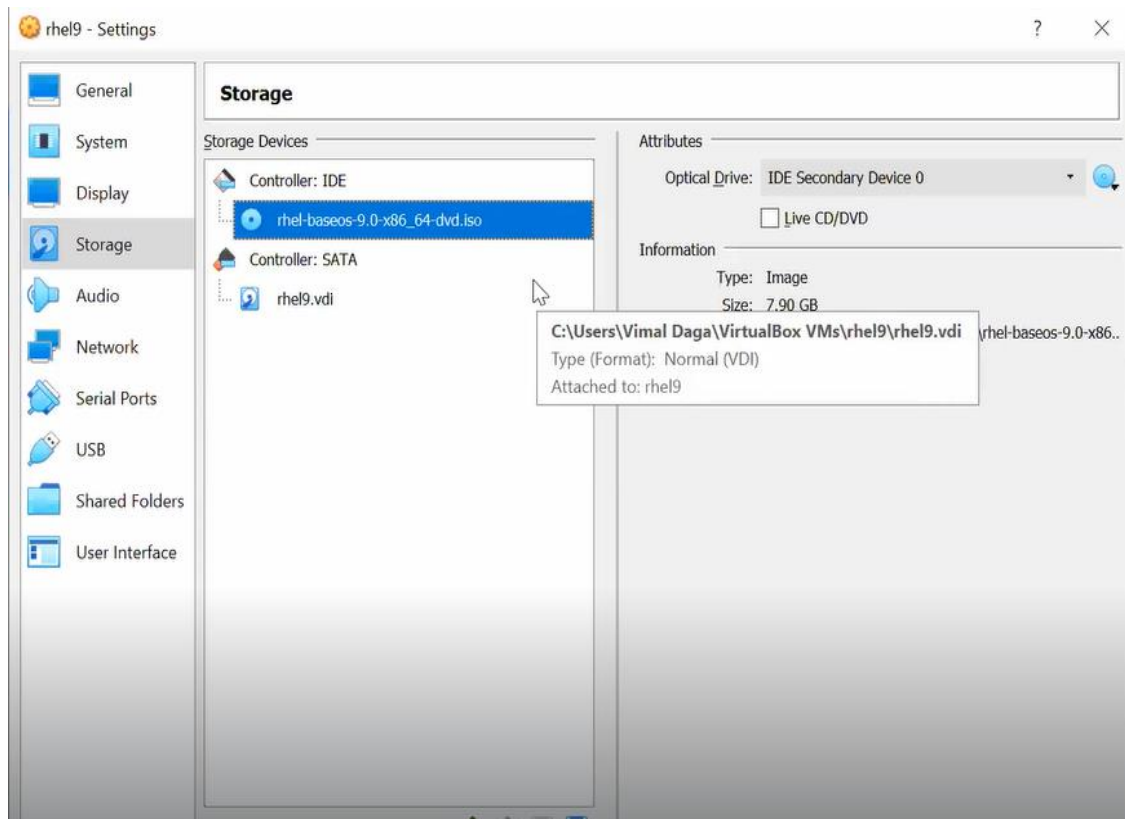

- To improve the performance – click on Settings

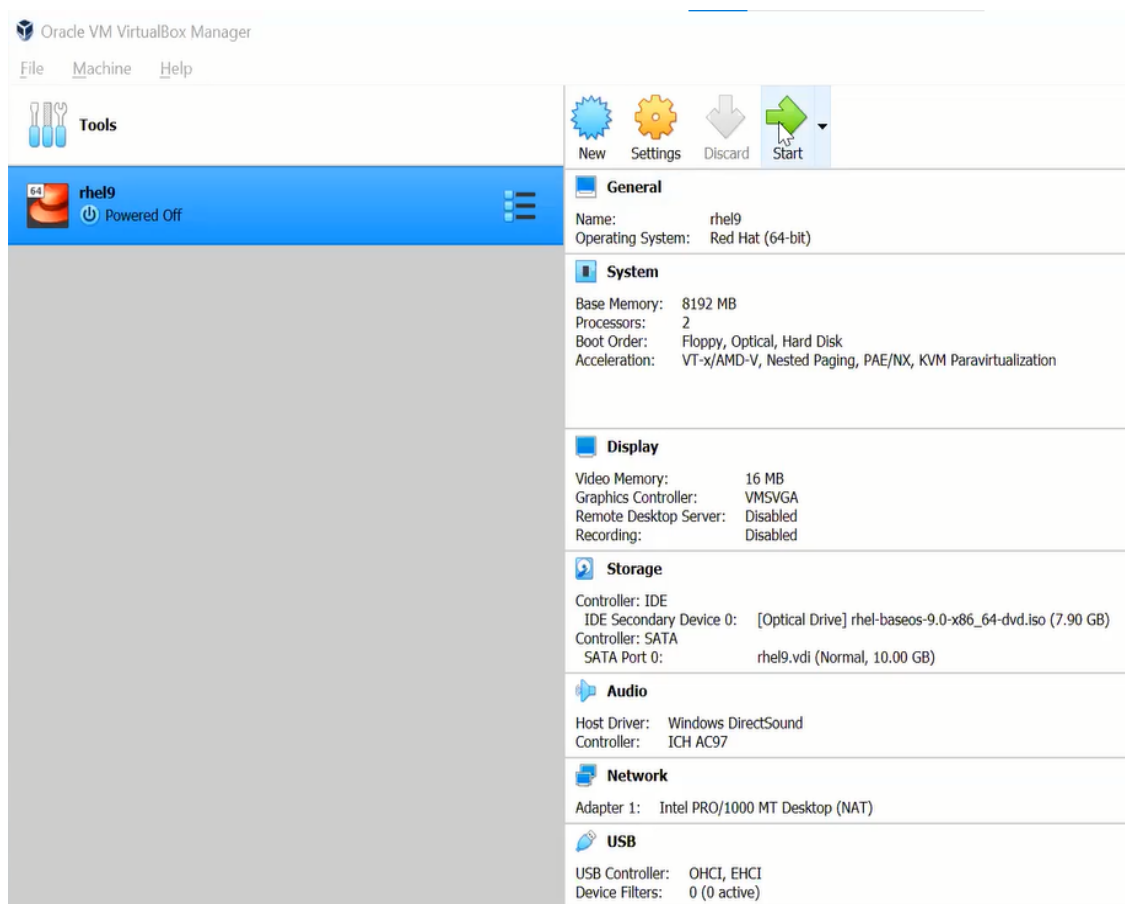

➤ To attach the image

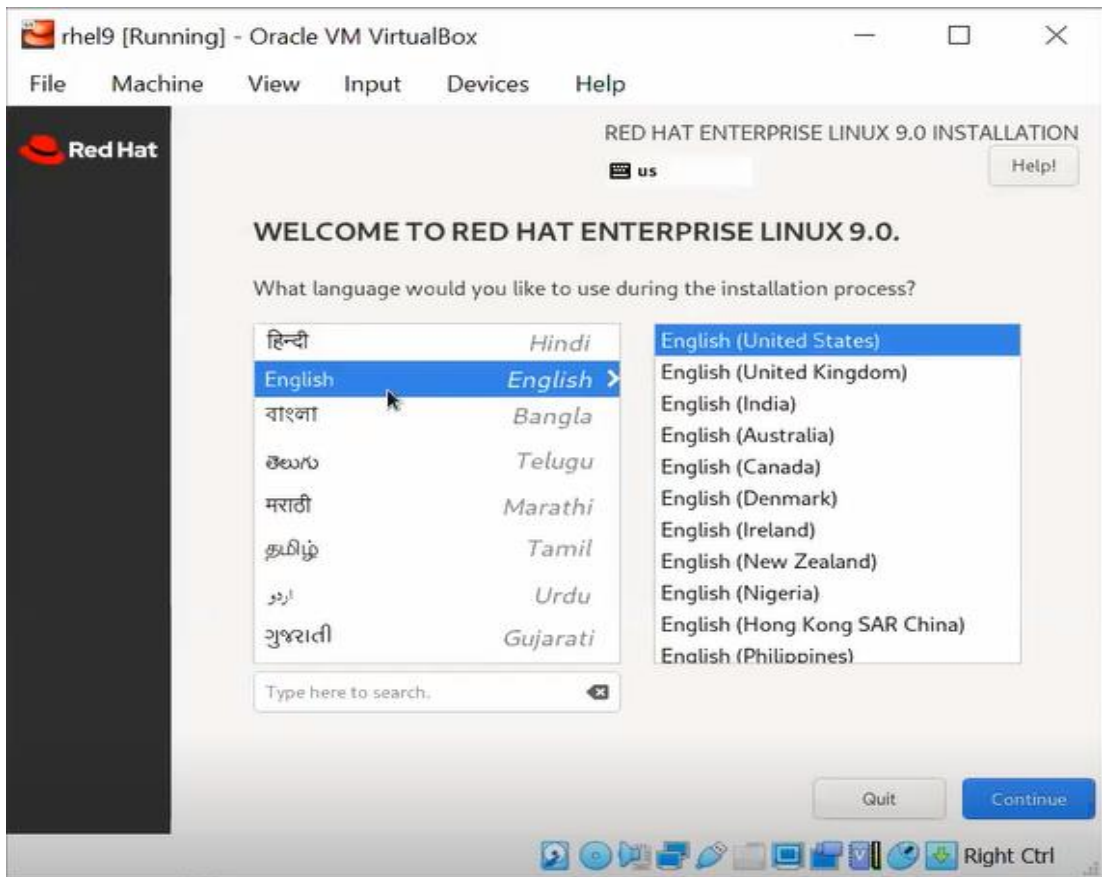

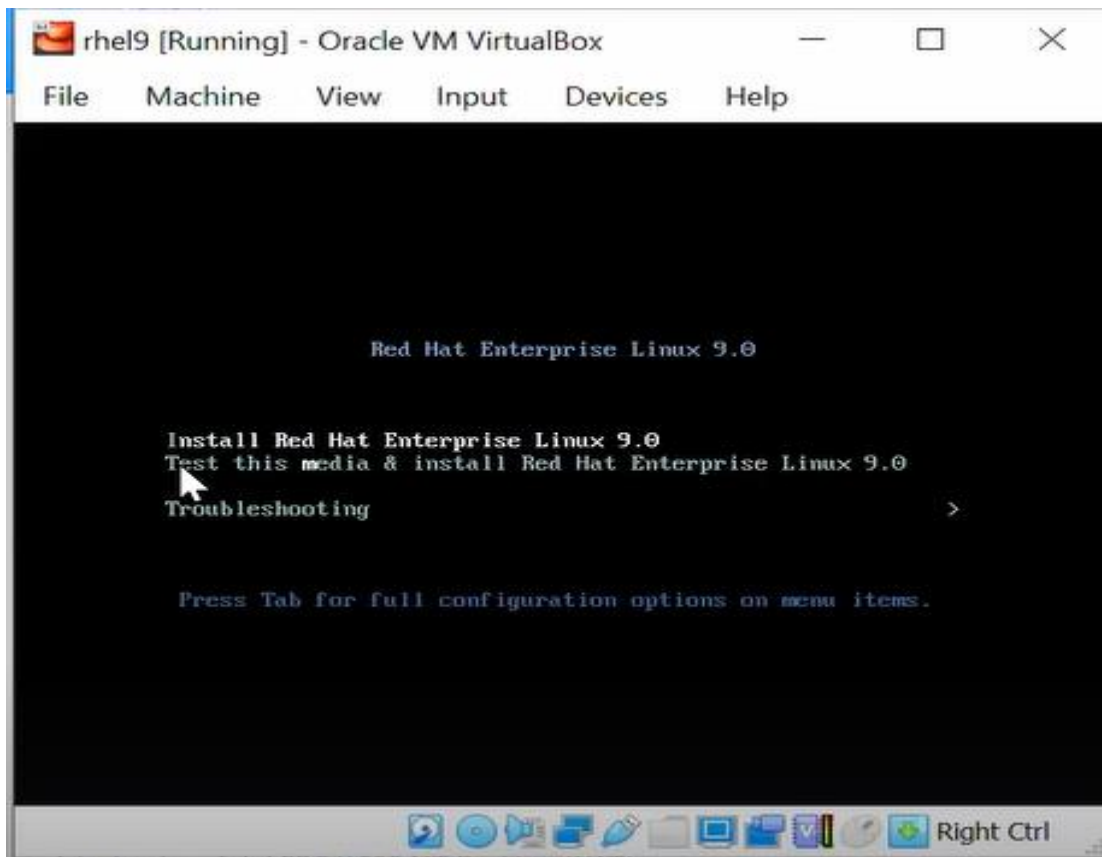

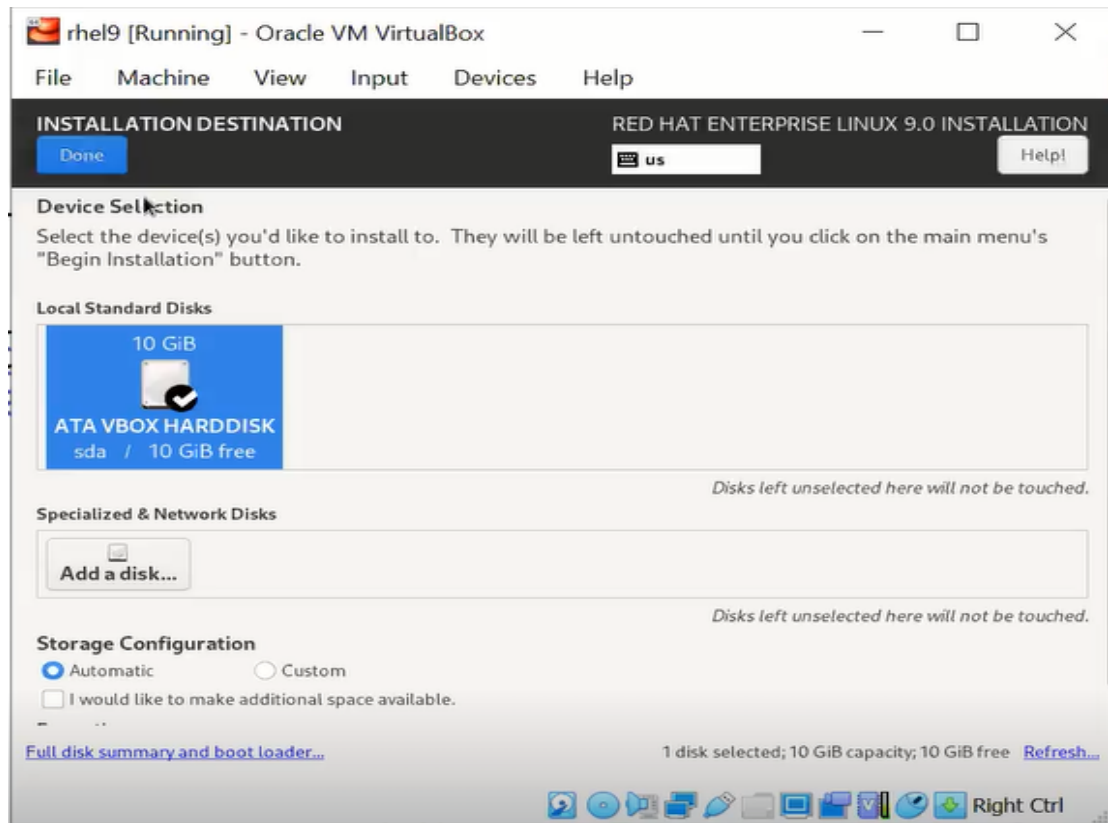

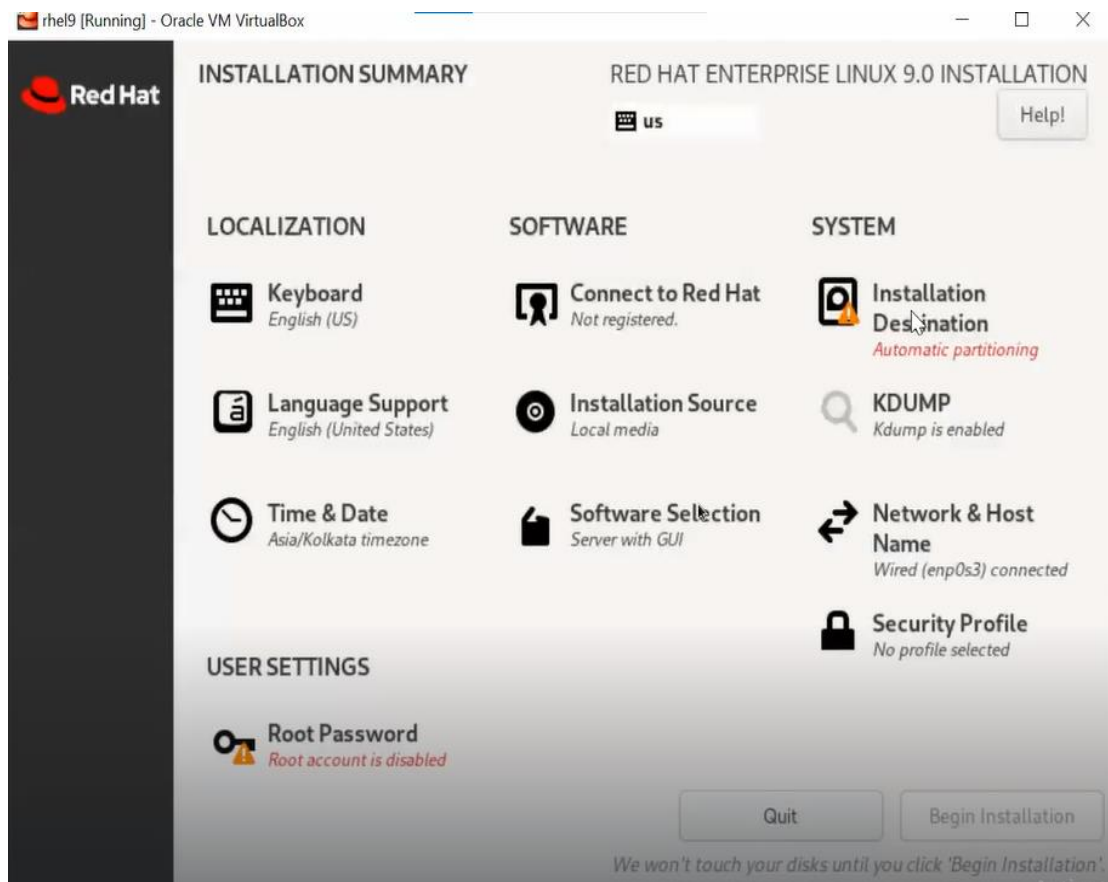

➤ Click on Start

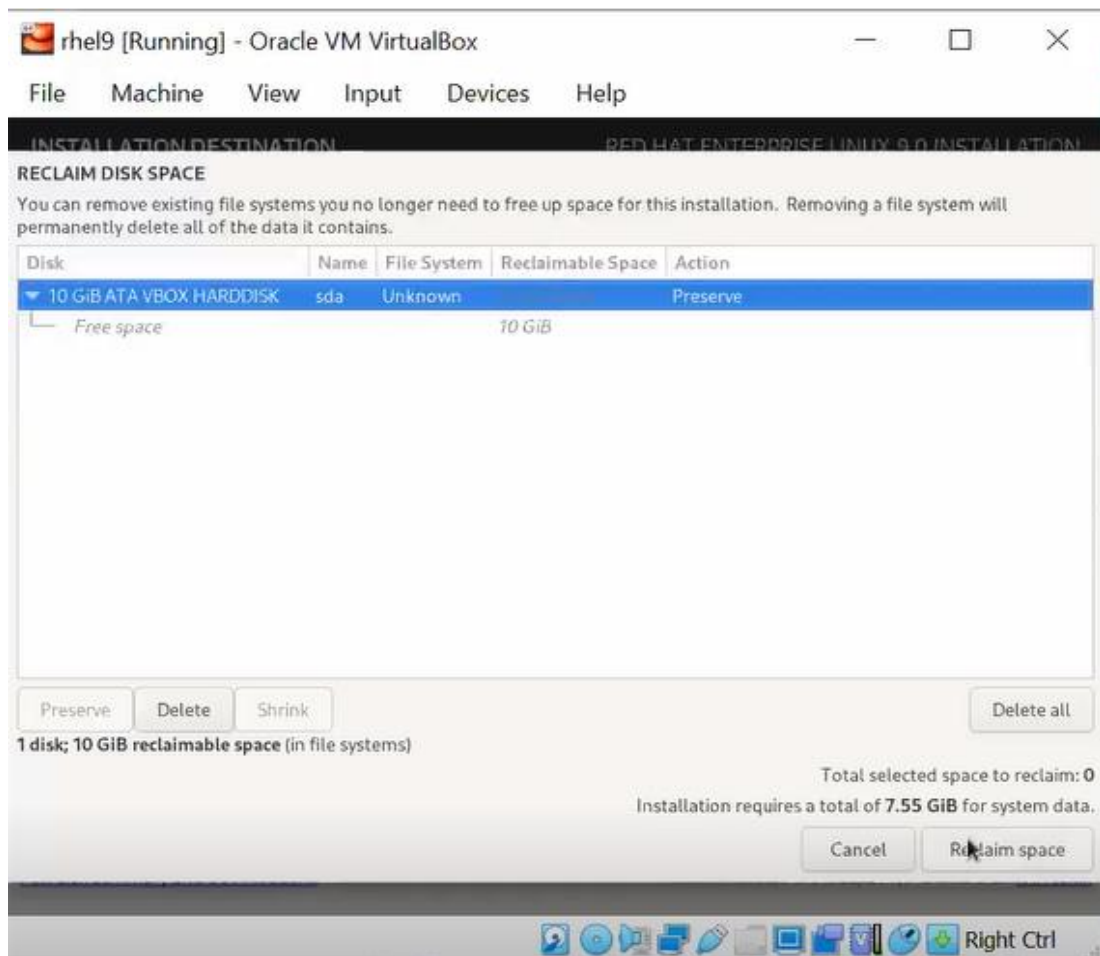

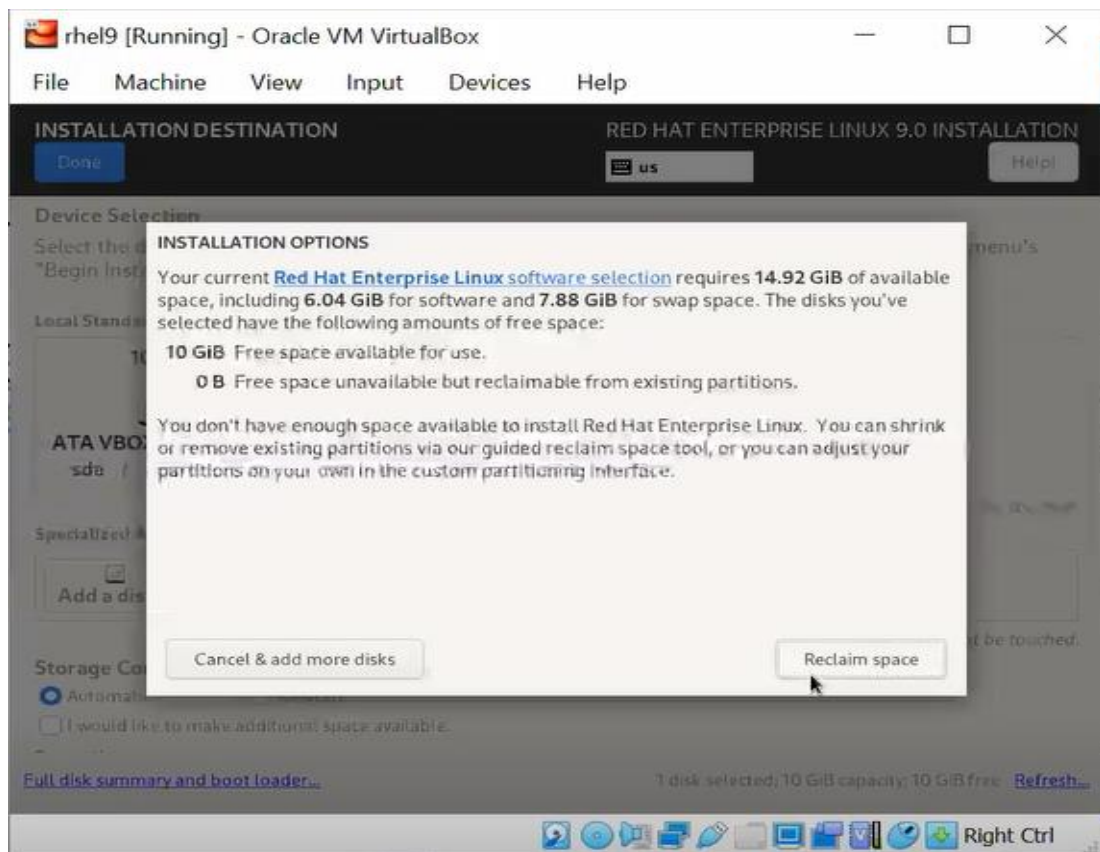

- Use up arrow key – select RHEL 9.0 and Enter key

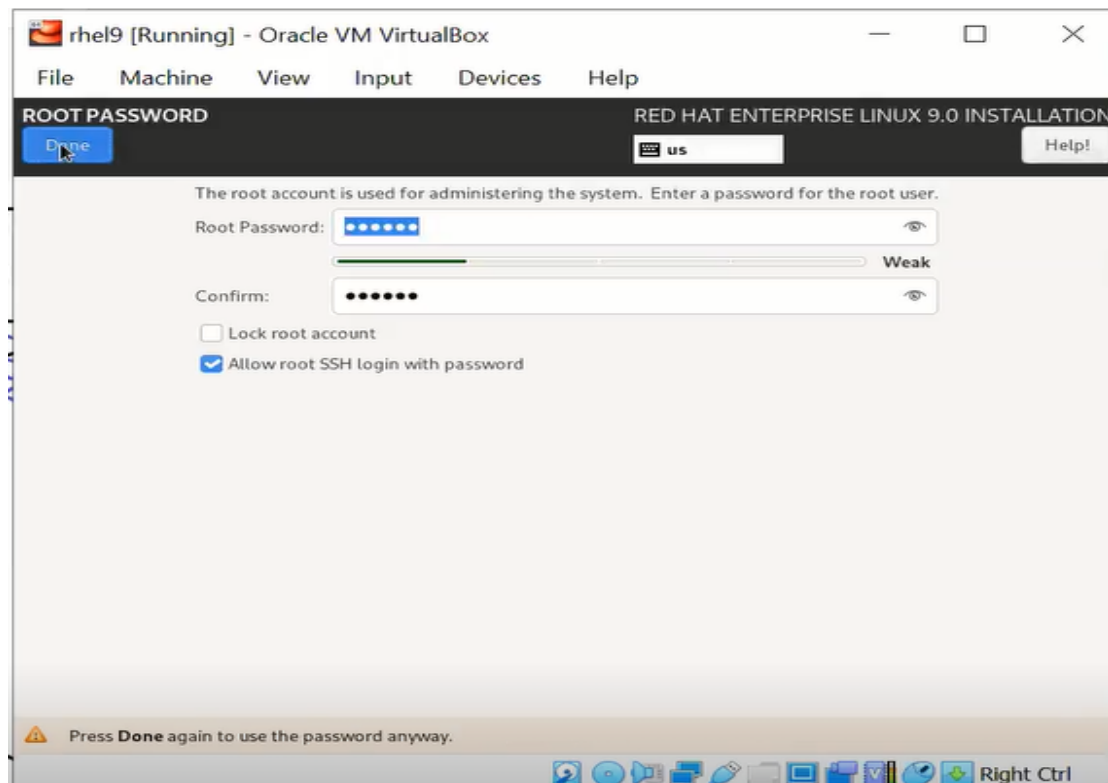

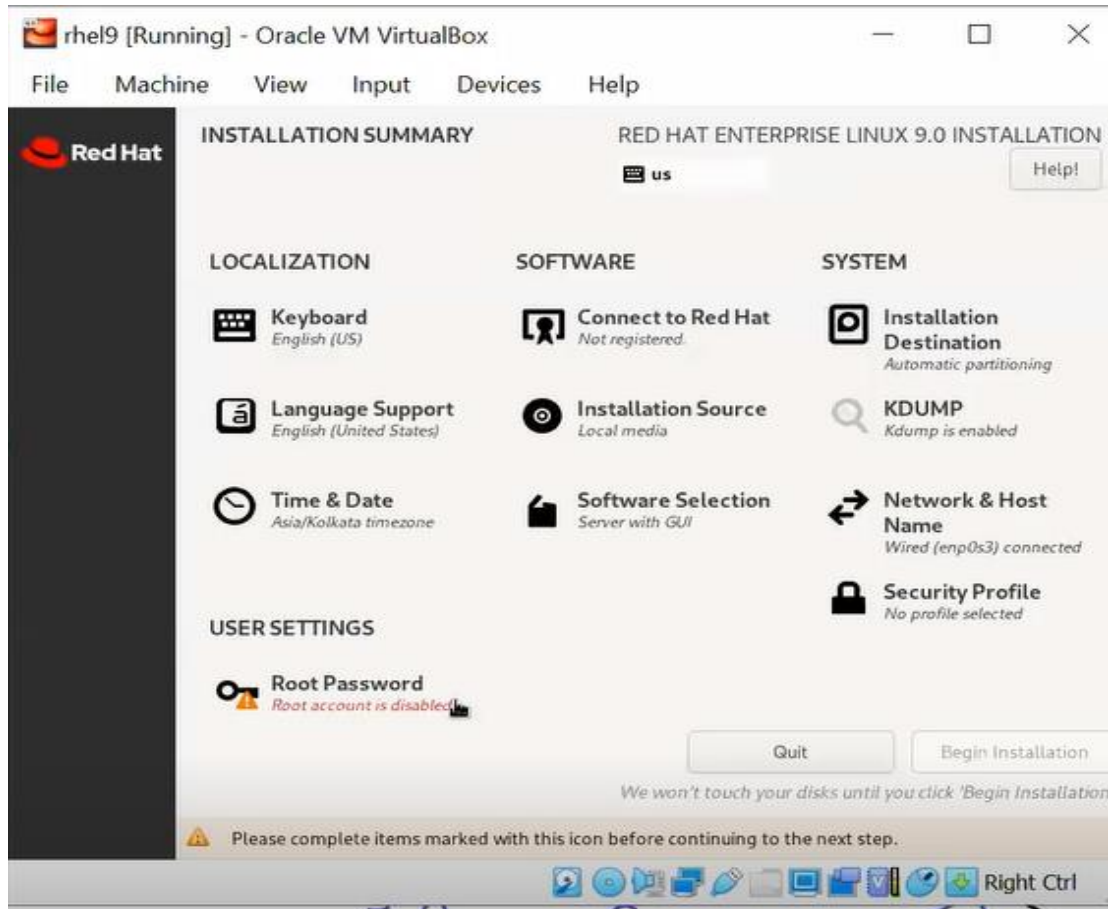

➤ Click on Installation Destination

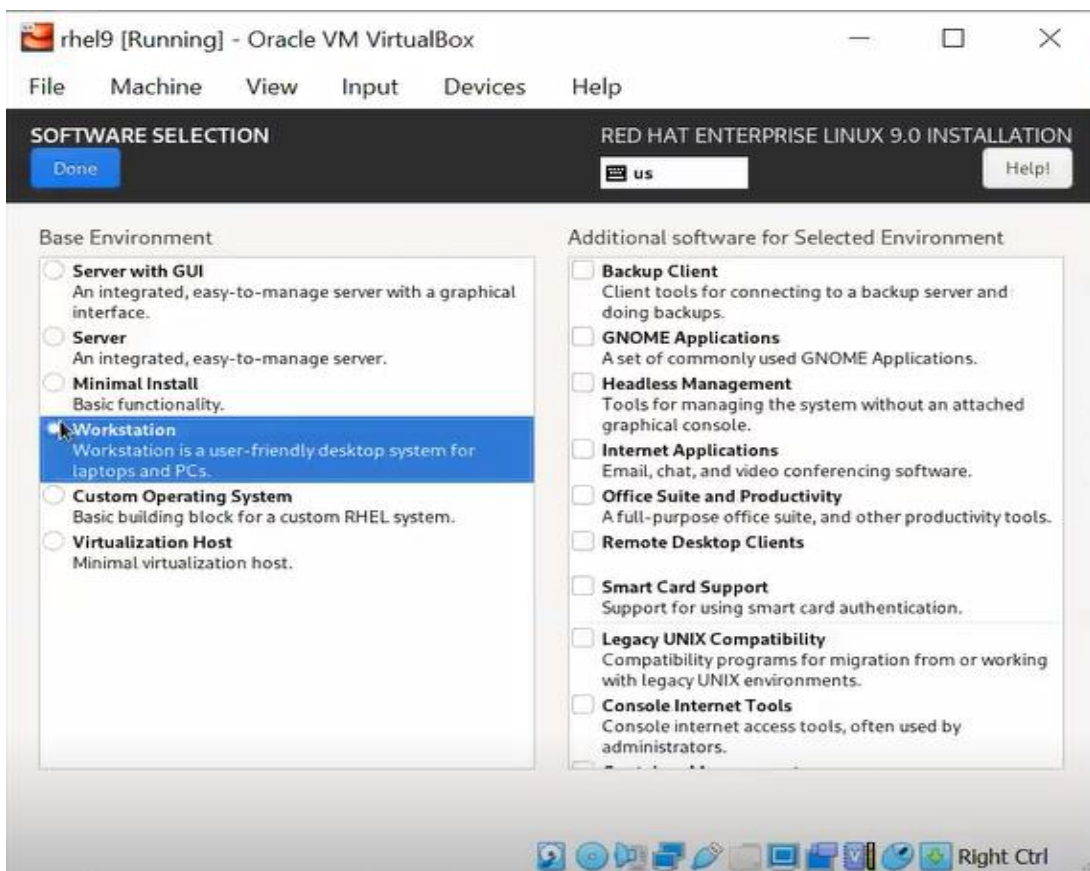

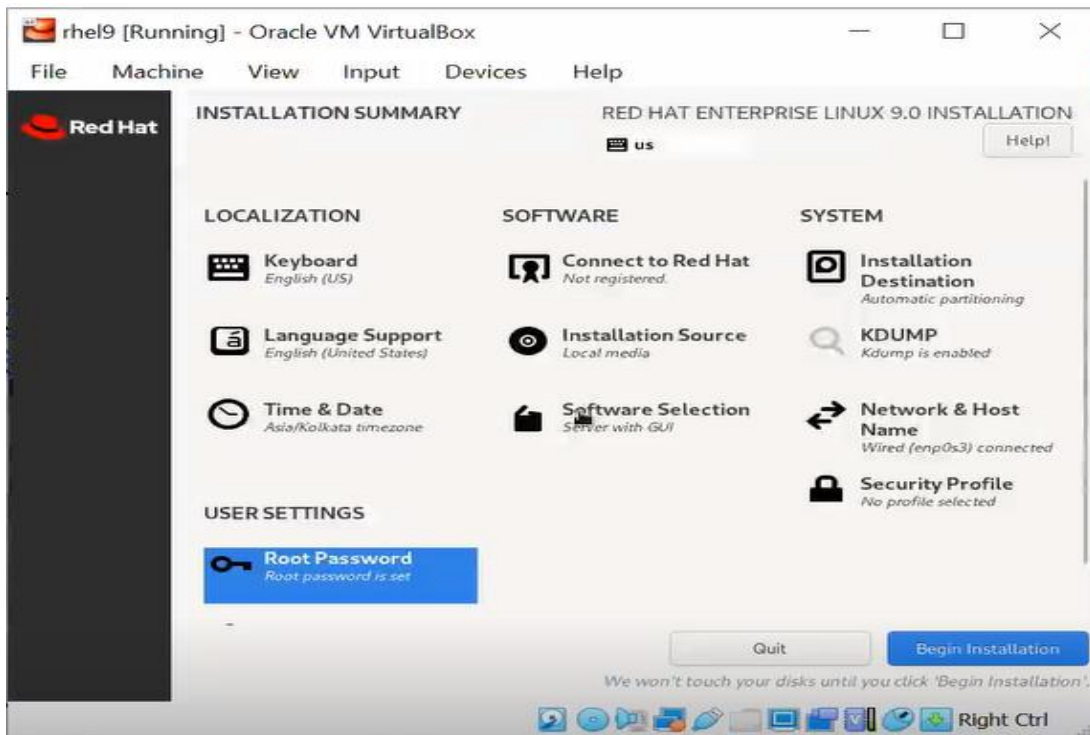

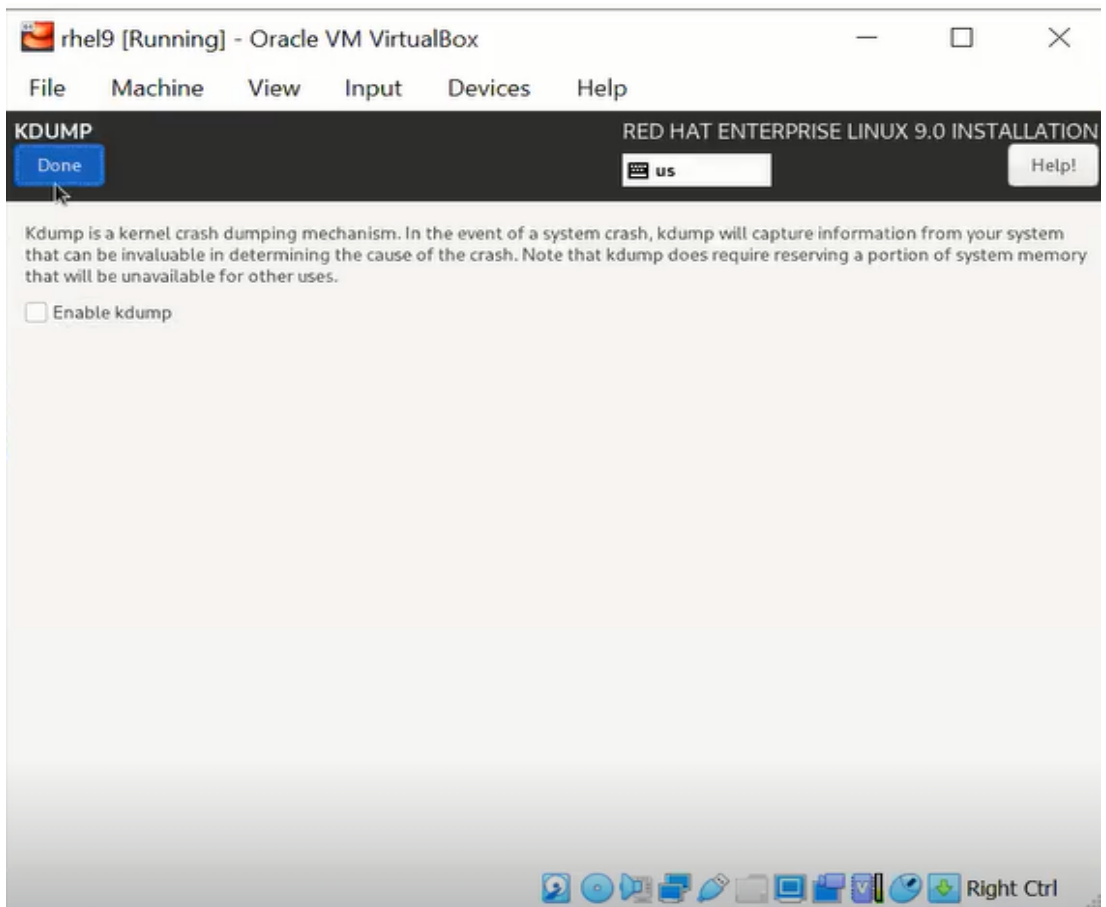

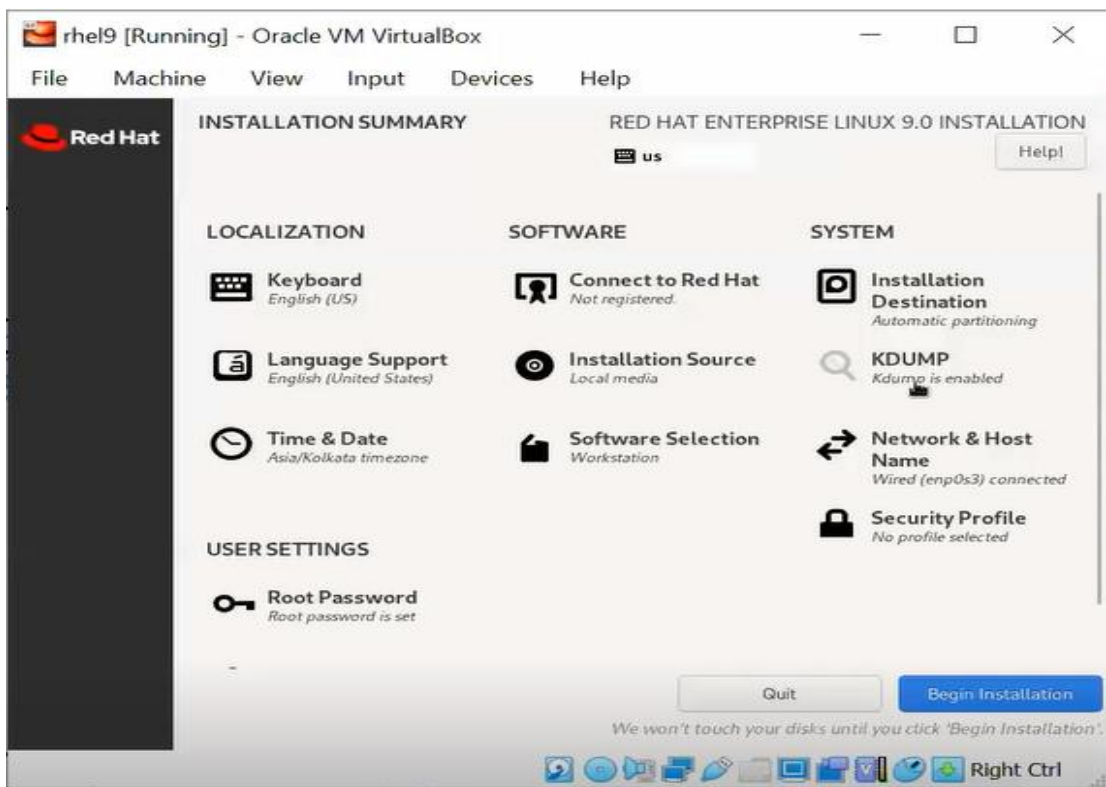

- Login to OS, we need an account- Admin account – in Linux the name is Root – with unlimited power

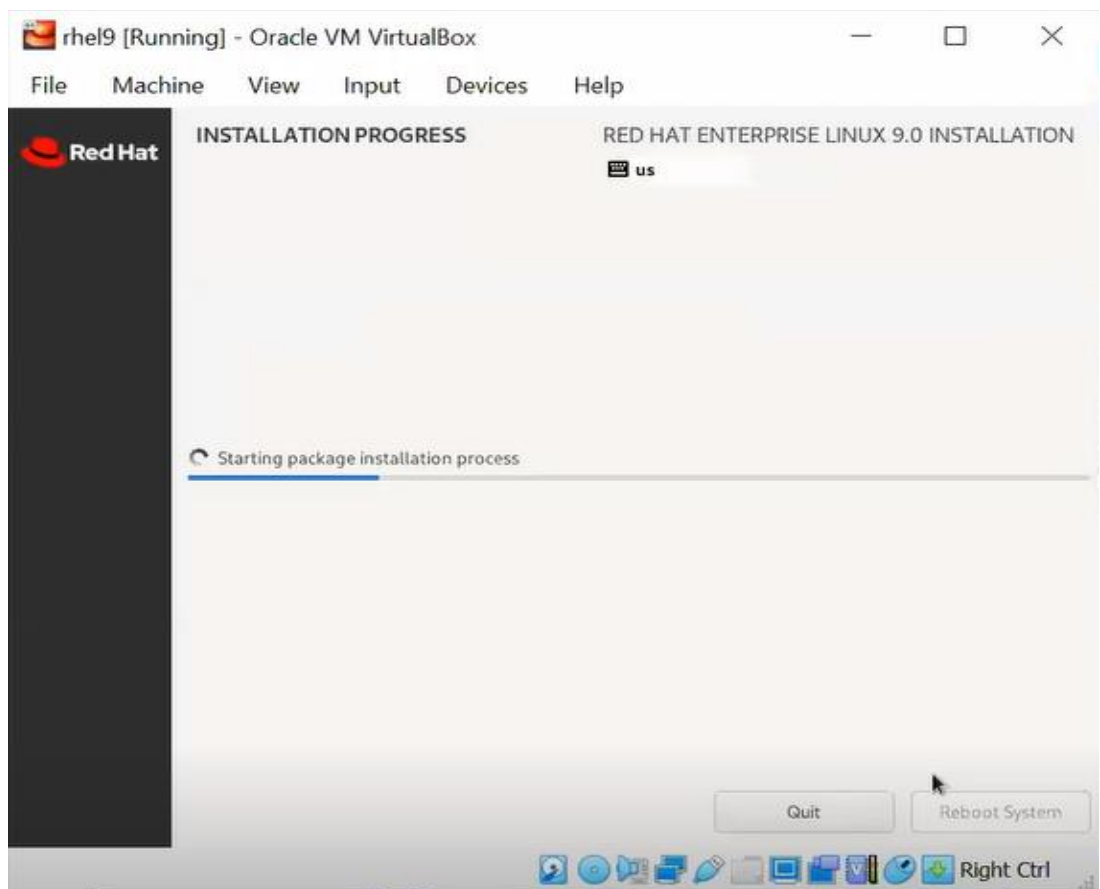

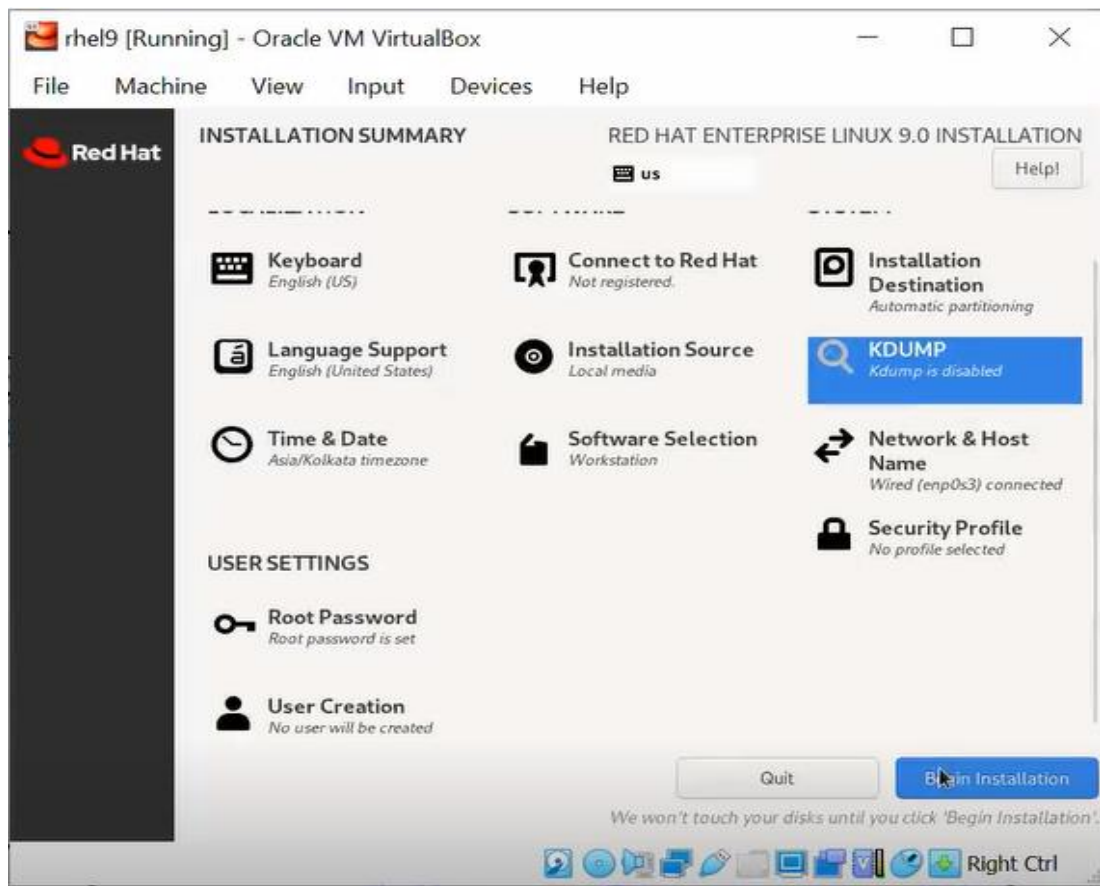

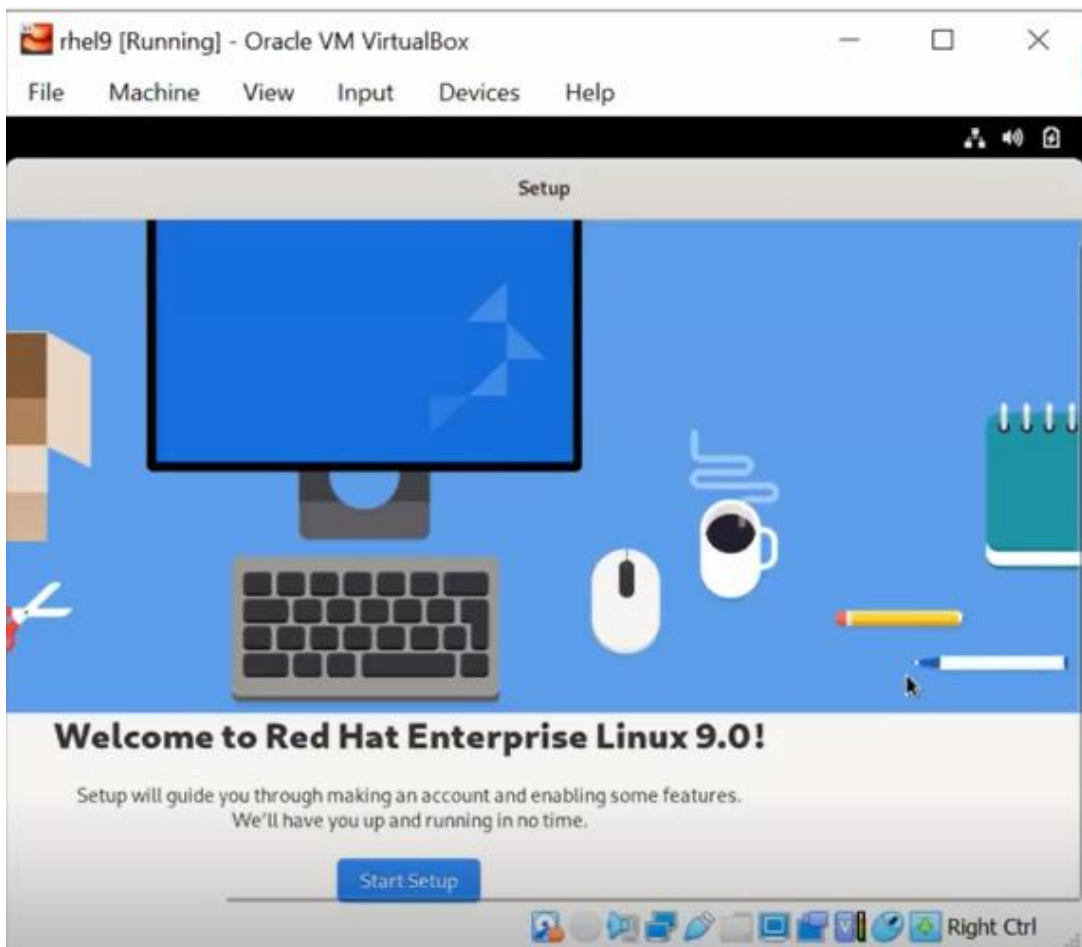

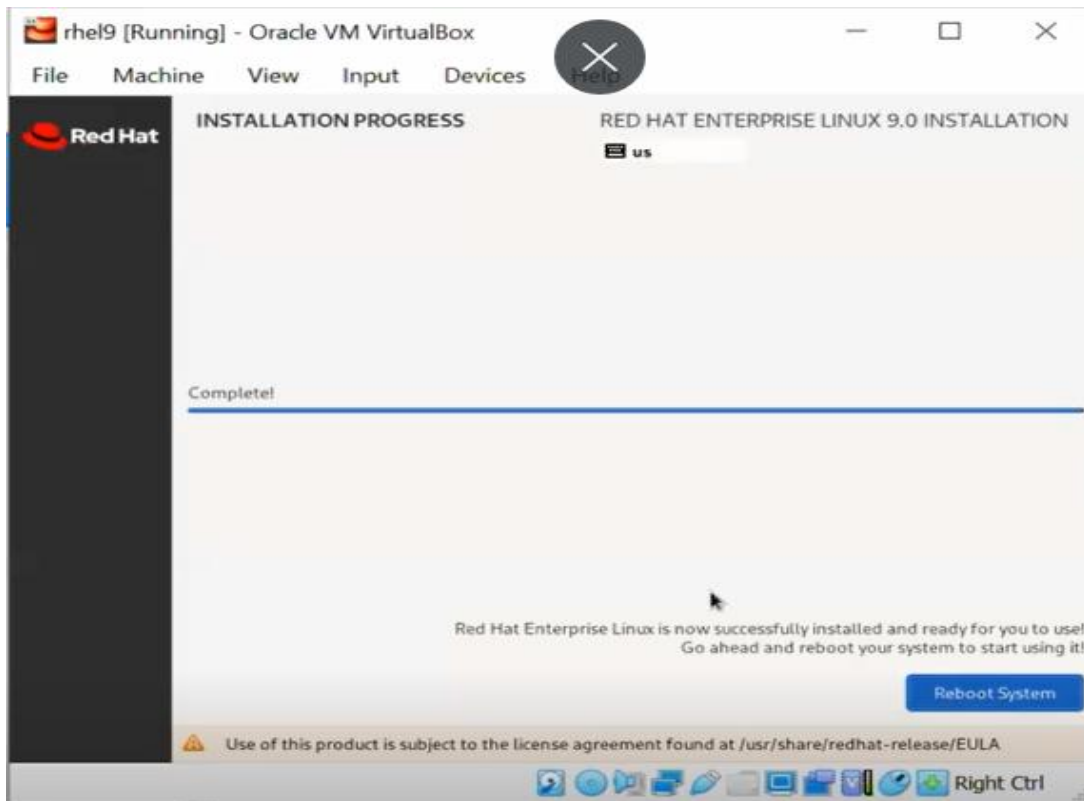

- Click on software selection

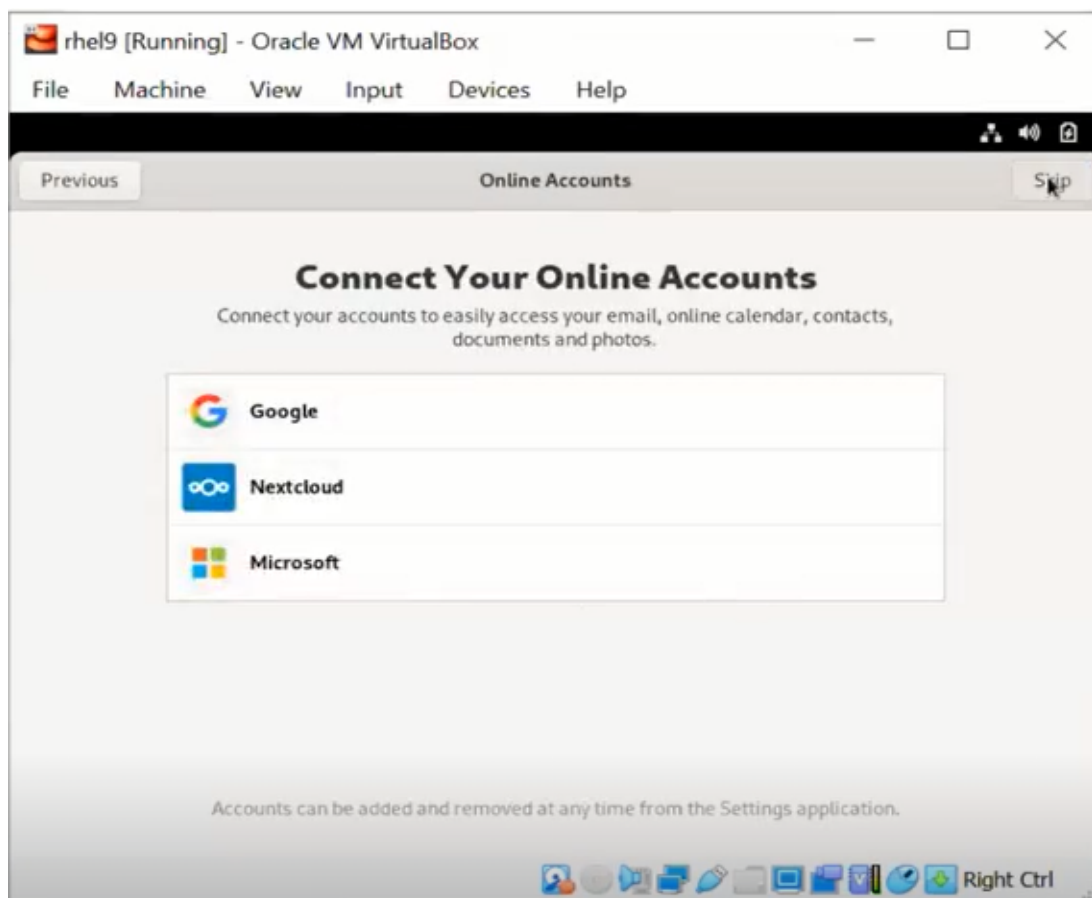

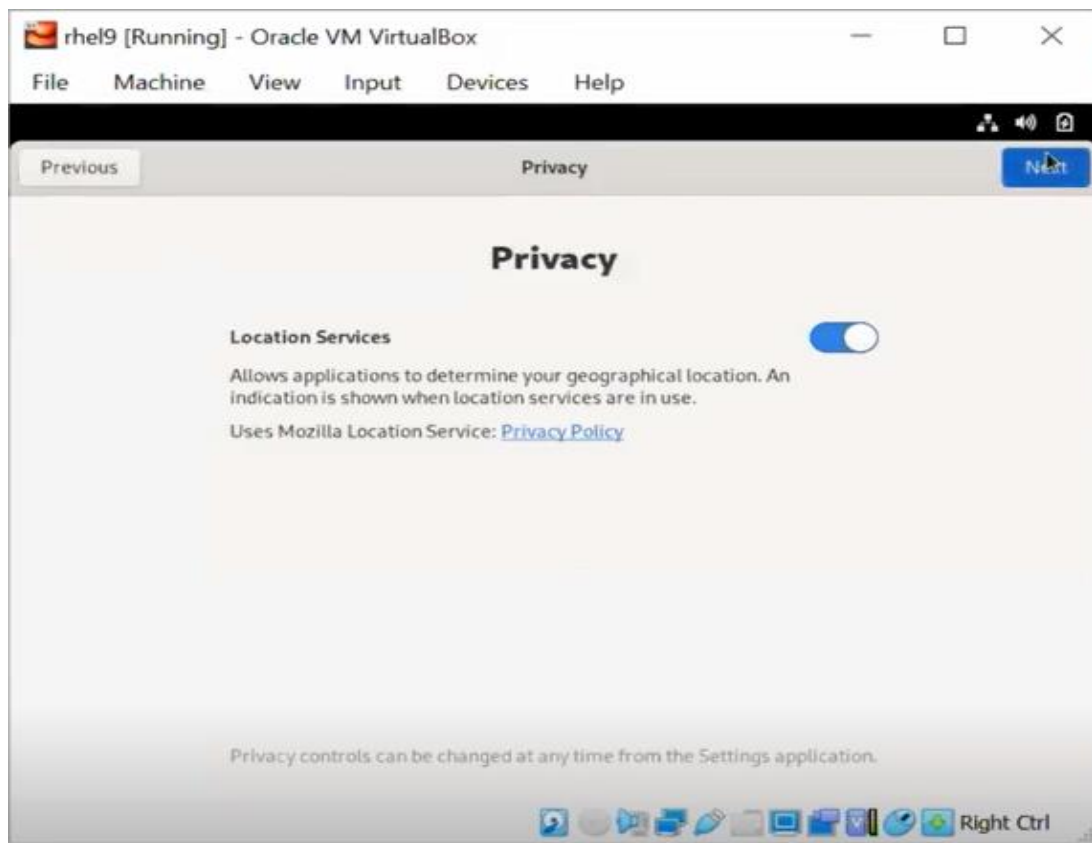

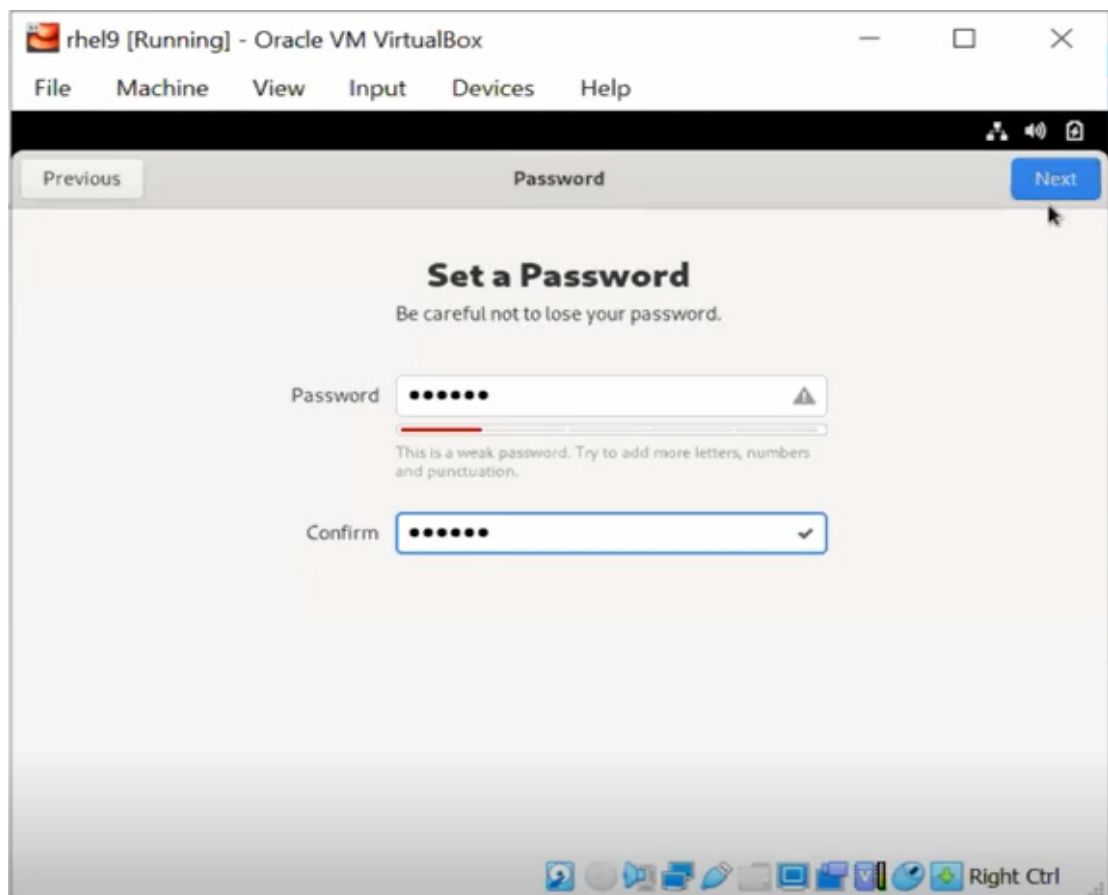

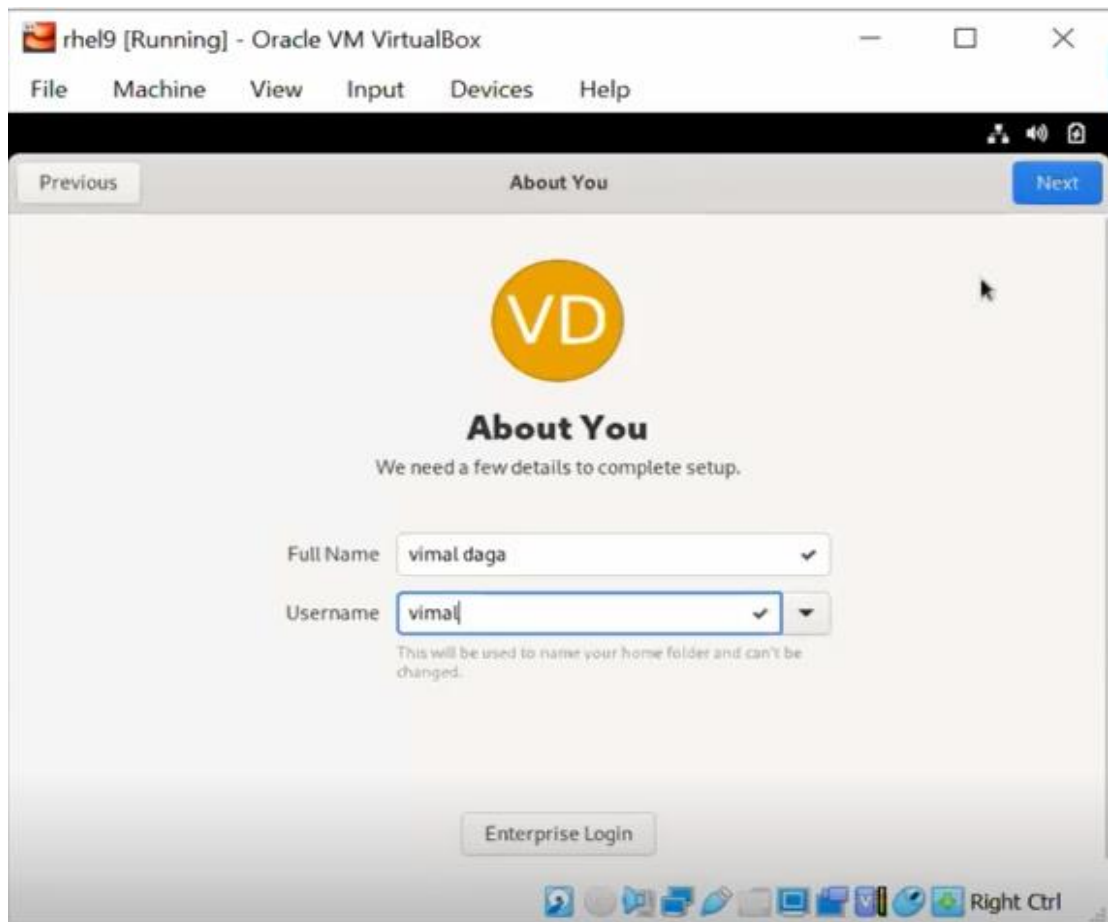

- Click on KDUMP – to save some of the memory space

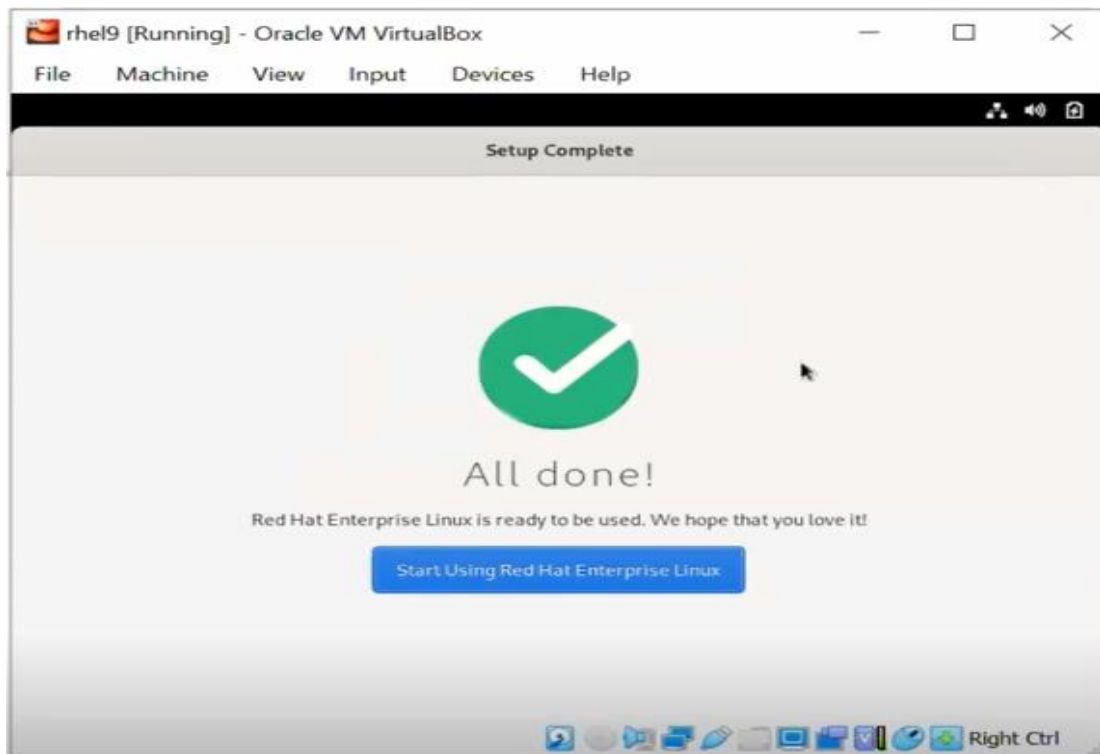

- In Linux the users are
 - Root users – unlimited power
 - Non Root users – limited power
- As Non Root user – we cannot install software or add users

A screenshot of a terminal window within a VirtualBox environment. The window title is 'rhel9 [Running] - Oracle VM VirtualBox'. The terminal shows a user named 'vimal' at 'localhost' with a tilde (~) as the home directory. The user runs the command 'pwd', which returns '/home/vimal'. Then, the user runs 'whoami', which returns 'vimal'. Finally, the user runs 'yum install vlc'. The terminal output shows an error: 'Not root, Subscription Management repositories not'. Below this, a message states: 'This system is not registered with an entitlement s on-manager to register.' and another error message: 'Error: There are no enabled repositories in "/etc/y d", "/etc/distro.repos.d".' The prompt returns to '[vimal@localhost ~]\$'.

- Command to find the location of a program

```
vimal@localhost:~  
[vimal@localhost ~]$ which firefox  
/usr/bin/firefox  
[vimal@localhost ~]$
```

- Command to change the directory

```
[vimal@localhost ~]$ cd /usr/bin/  
[vimal@localhost bin]$
```

- Command to see the present working directory

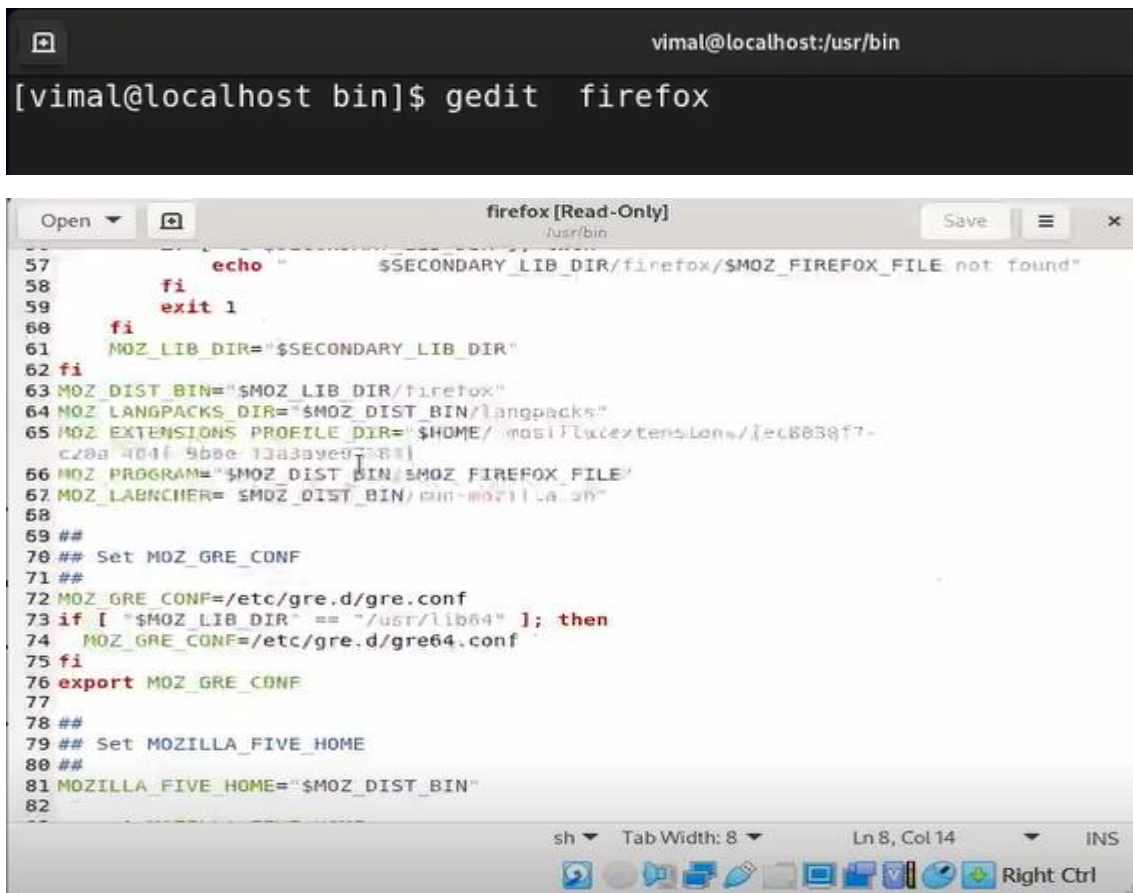

```
[vimal@localhost bin]$ pwd  
/usr/bin
```

- Command to list the files

```
[vimal@localhost bin]$ ls
```

```
vimal@localhost:/usr/bin  
find sha224hmac  
findmnt sha224sum  
fips-finish-install sha256hmac  
fips-mode-setup sha256sum  
firefox sha384hmac  
firewall-cmd sha384sum  
firewall-offline-cmd sha512hmac  
flatpak sha512sum  
flatpak-bisect showconsolefont  
flatpak-coredumpctl showkey  
flock shred  
fmt shuf  
fold simc_lsmpplugin  
foomatic-combo-xml sim_lsmpplugin  
foomatic-compiledb size  
foomatic-configure skill  
foomatic-datafile slabinfo  
foomatic-perl-data slabtop  
foomatic-ppdfile sleep  
foomatic-ppd-options sliceprint
```

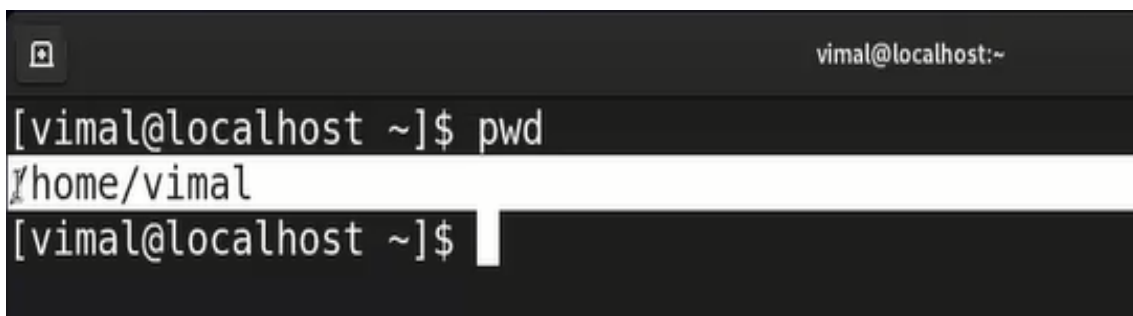

- Command to open the file

The first screenshot shows a terminal window with the prompt `vimal@localhost:~` and the command `gedit firefox` entered. The second screenshot shows the Gedit editor window titled `firefox [Read-Only]` displaying the contents of the `firefox` file. The file is a shell script that sets environment variables for Firefox, including `MOZ_LIB_DIR`, `MOZ_DIST_BIN`, `MOZ_LANGPACKS_DIR`, `MOZ_EXTENSIONS_PROFILE_DIR`, `MOZ_PROGRAM`, `MOZ_LAUNCHER`, `MOZ_GRE_CONF`, and `MOZILLA_FIVE_HOME`.

```
57     echo "          $SECONDARY_LIB_DIR/firefox/$MOZ_FIREFOX_FILE not found"
58     fi
59     exit 1
60 fi
61 MOZ_LIB_DIR="$SECONDARY_LIB_DIR"
62 fi
63 MOZ_DIST_BIN="$MOZ_LIB_DIR/firefox"
64 MOZ_LANGPACKS_DIR="$MOZ_DIST_BIN/langpacks"
65 MOZ_EXTENSIONS_PROFILE_DIR="$HOME/.mozilla/extensions/[ec889f7-
66   c20a 4041 9b8e 13a38e9788]
67 MOZ_PROGRAM="$MOZ_DIST_BIN/$MOZ_FIREFOX_FILE"
68 MOZ_LAUNCHER="$MOZ_DIST_BIN/bin-mozilla-launcher"
69 ##
70 ## Set MOZ_GRE_CONF
71 ##
72 MOZ_GRE_CONF=/etc/gre.d/gre.conf
73 if [ "$MOZ_LIB_DIR" == "/usr/lib64" ]; then
74     MOZ_GRE_CONF=/etc/gre.d/gre64.conf
75 fi
76 export MOZ_GRE_CONF
77
78 ##
79 ## Set MOZILLA_FIVE_HOME
80 ##
81 MOZILLA_FIVE_HOME="$MOZ_DIST_BIN"
82
```

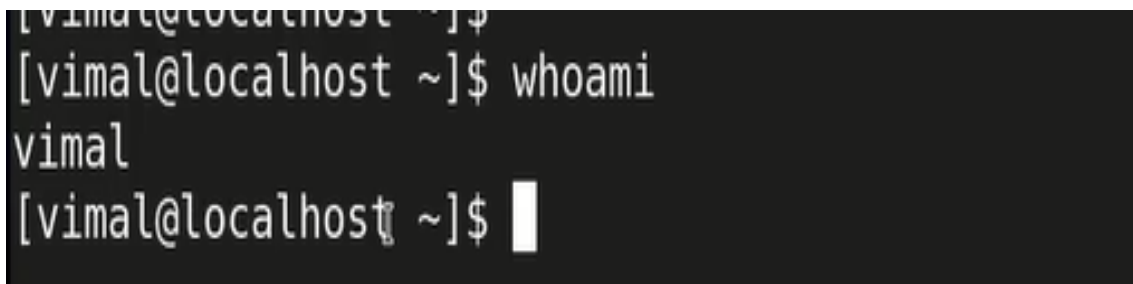

- The home directory of the user

The screenshot shows a terminal window with the prompt `vimal@localhost:~` and the command `pwd` entered. The output of the command is `/home/vimal`.

```
[vimal@localhost ~]$ pwd
/home/vimal
[vimal@localhost ~]$
```

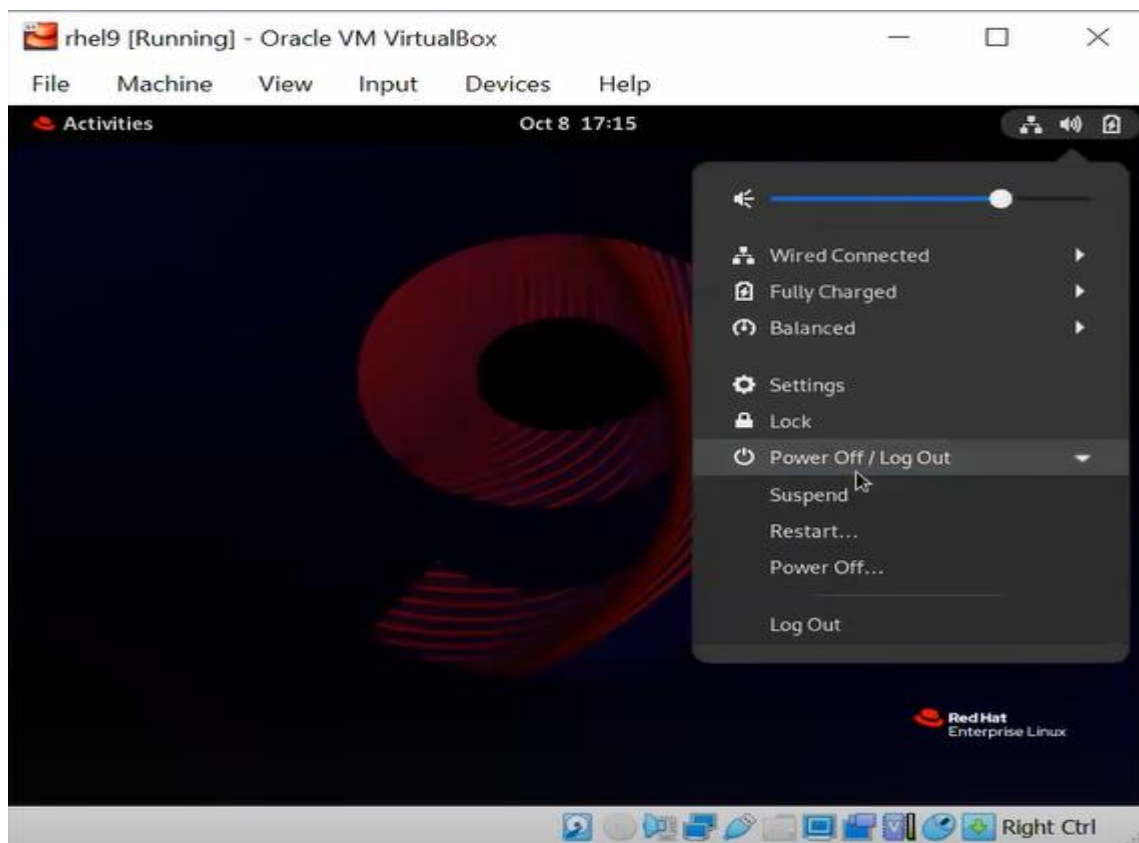

- Command to check who has logged in

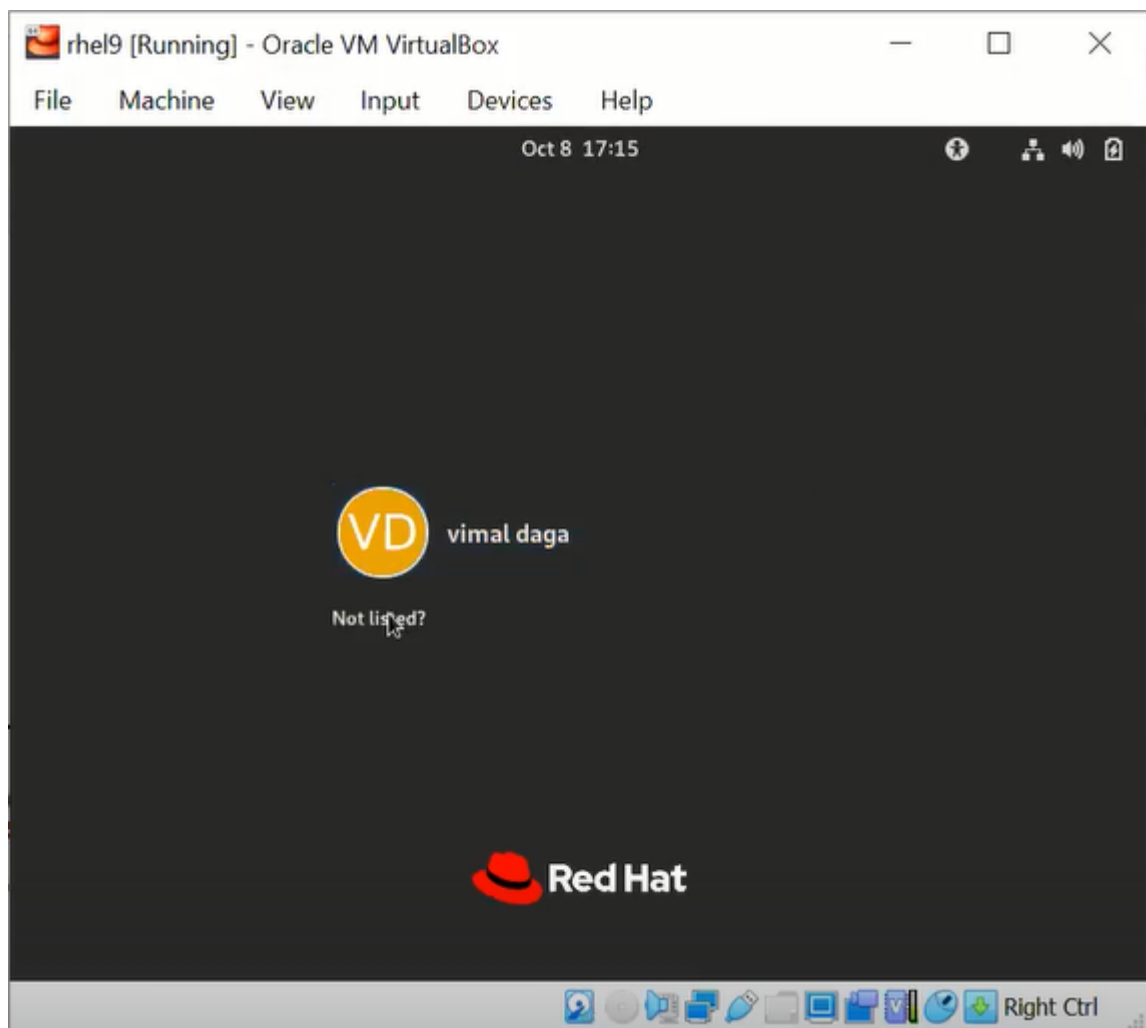

The screenshot shows a terminal window with the prompt `vimal@localhost:~` and the command `whoami` entered. The output of the command is `vimal`.

```
[vimal@localhost ~]$ whoami
vimal
[vimal@localhost ~]$
```

➤ From GUI – Logout

- Login as Root user -

- Command to create a new user

```
root@localhost:~  
[root@localhost ~]# whoami  
root  
[root@localhost ~]# id tom  
id: 'tom': no such user  
[root@localhost ~]# id vimal  
uid=1000(vimal) gid=1000(vimal) groups=1000(vimal)  
[root@localhost ~]#  
[root@localhost ~]#  
[root@localhost ~]# useradd tom  
[root@localhost ~]# id tom  
uid=1001(tom) gid=1001(tom) groups=1001(tom)  
[root@localhost ~]#
```

- Command to create a password

```
[root@localhost ~]# passwd tom
Changing password for user tom.
New password:
BAD PASSWORD: The password is a palindrome
Retype new password:
passwd: all authentication tokens updated successfully.
[root@localhost ~]#
```

- Now RHEL9 is running inside the Oracle Virtual Box – two OS with one mouse
- Use the right side “ctrl” key to take the mouse out of Linux to Windows
- The three different ways to interact with OS
 - GUI (Graphical User Interface)
 - CLI (Command Line Interface)
 - WebUI (Web User Interface)
- In Linux we have multiuser facility – to switch between consoles or virtual terminals(VT's) – (left) ctrl + Alt + F
- The function key F2 is for GUI and F3 to F6 are for CLI
- Command to see the terminal number

```
[root@localhost ~]# tty
/dev/tty6
[root@localhost ~]#
[root@localhost ~]#
```

- Command to go to a particular terminal

```
[root@localhost ~]#
[root@localhost ~]# chvt 3
```

- Command to check who has logged in at what time and which terminal

```
[root@localhost ~]# who
root      tty2      2022-10-08 17:15 (tty2)
tom       tty3      2022-10-08 17:21
vimal     tty4      2022-10-08 17:21
root      tty6      2022-10-08 17:25
[root@localhost ~]#
```

- Command to see only the month

```
[root@localhost ~]# date +%h  
Oct
```

- Command to refer the manual

```
[root@localhost ~]# man date
```

```
DATE(1)                                User Commands                                DATE(1)

NAME
    date - print or set the system date and time

SYNOPSIS
    date [OPTION]... [+FORMAT]
    date [-u|--utc|--universal] [MMDDhhmm[[CC]YY][.ss]]

DESCRIPTION
    Display the current time in the given FORMAT, or set the sys-
    tem date.

    Mandatory arguments to long options are mandatory for short
    options too.

    -d, --date=STRING
        display time described by STRING, not 'now'

    --debug
        annotate the parsed date, and warn about questionable
        usage to stderr
```
